A number of departmental committees were also nominated to consider the after-war position of the textile, engineering, iron and steel, and electrical trades. The recommendations of these bodies included the removal of the Government control of industries as soon as possible, the formation of a new Board of Trade Department for commerce and industry, a system of preference within the Empire, legislation against "dumping," the marking of all goods of foreign origin "Not British," the admission to this country of raw materials duty free, the harmonisation of the patent laws throughout the Empire, and the prohibition of Conference arrangements between British ship-owners and enemies for a period of three years after the war. The Committees also proposed that the Allies should be invited to consider the imposition of an additional duty or surtax over and above their normal duties to be levied solely against the products of enemy countries and to be subject to progressive diminution, Great Britain imposing a duty equal to this surtax.

The problems of demobilisation were divided among a number of committees, one of which, appointed to advise as to the arrangements to be made for disbanding civil war workers, issued an interim report recently. The Committee dealt mainly with munition workers, the number of whom they estimated at nearly eight million. The employment of the majority of these would cease with the end of the war, and the Government were recommended to take steps to assist those discharged to return to their former or other employment. It was proposed that as soon as there was a reasonable prospect of peace the Local Advisory Committees and the Employment Exchanges should ascertain where workers were likely to be required immediately on the termination of the war, and what the demands of individual factories were likely to be. The details of this scheme should be worked out by the Ministry of Labour, care being taken that the assistance of trade unions should be secured.

The Committee also suggested that arrangements should be made in connexion with the termination of Government contracts whereby munition workers should receive a fortnight's notice or a fortnight's wages in lieu of notice, and that steps should be taken by the Departments concerned to encourage Government Departments, public or semi-public bodies, and

private employers to place post-war contracts in advance, the contracts being arranged, if necessary, at provisional prices to be adjusted later according to revised estimates of the cost of labour, materials, and other things, or, as an alternative, on a profit basis. Similar measures should be taken by the Department of Overseas Trade through their Trade Commissioners and Commercial Attachés abroad. The Government should have in readiness before the end of the war further schemes to meet the possibility of any local or general unemployment which may prove to be more than of a temporary nature.

With regard to questions of employment, the most notable inquiry concerned the relations between employers and employed, the result of which was a proposal to form Councils in each trade in order to secure the review by both sides affected of those relations with a view to their improvement. The Government adopted the plan, and considerable progress has already been made in establishing these bodies of representatives of both sides, some of them having already been called upon to settle threatened disputes in particular industries.

Various suggestions to increase our home-grown food supplies in the interest of national security were made by the Agricultural Policy Committee after an investigation extending over nearly two years. They came to the conclusion that in any future crisis like the war the nation must be wholly independent of overseas supplies of corn, potatoes or dairy produce, and less dependent on overseas supplies of meat than hitherto. Urging that the principles of the Corn Production Act should be embodied in a permanent statute, the Committee declared that unless this were done there could be no hope of the people of the United Kingdom becoming emancipated from dependence on overseas supplies of foodstuffs or of the increase of our rural population. Greater facilities for purchase by smallholders were recommended, and the utilisation of deer forests suitable for agriculture and forestry. The procedure in respect of loans, it was urged, should be cheapened and simplified, and short-term credit provided through co-operative trading societies and farmers' central trading boards, and the Committee proposed that deposits in the Post Office Savings Bank should be made available for use by central trading boards.

Of the many other problems dealt with at the request of the new Ministry, that of education was the most important. A strong plea was made by a representative committee for a reconstruction of many of the conditions of daily life in order that the workers might have fuller opportunities to satisfy the craving for knowledge and a finer life. They recommended, therefore, that the maximum legal working day should not be more than eight hours, that overtime should be reduced to a minimum, and that regular night work should be prohibited except when essential. In order to do away with the effects of monotonous work, the Committee proposed that alternative forms of employment should be encouraged. They also urged an extension to the wage earners of the custom among salaried workers of payment during holidays, emphasised the vital necessity of a comprehensive scheme of housing reform, and as an aid towards reconstruction in the conditions of village life recommended the provision of a hall under public control in every village.

THE TURF.

SPORT was restricted to horse-racing during the past year, that is so far as concerned organised competition. With the youth of the nation engaged in more serious effort, such games as football, and cricket were not of the serious character of pre-war times. Athletics were confined to school and military circles, while rowing was at an entire standstill. Indoor games, such as boxing and billiards, were principally displays by professionals. It is recognised, however, that racing in England must, for the sake of the breed, be kept going, and so it was to a limited extent. In Ireland there was very little restriction, and not a few English owners sent their studs across the Channel.

The outstanding feature of the abbreviated racing season of 1918 was the remarkable success of the Manton stable, presided over by Alec Taylor. All the classic races, except the One Thousand Guineas, were secured by that establishment, as well as the Cesarewitch and several other valuable stakes. In the early part of the season a little racing took place at Birmingham, Dunstable Park, Gatwick, Haydock Park, Lewes, Lingfield, Manchester, Stockton, Windsor and Worcester, but after the end of May the Government represented to the Stewards of the Jockey Club that war transport entailed such demands on the railway service that racing at places other than Newmarket would be out of the question. From that time it was generally conceded that racing was conducted, not so much as a sport, but as a vital adjunct of the national industry of horse breeding, and the facilities for the public to be present were cut down most severely.

Nothing of great importance has to be chronicled concerning the outstanding meetings, but the doings at Newmarket were both interesting and valuable. The first gathering was in the middle of April, at the Craven meeting, when Lord Durham's br. c. Callander raised hopes, which were scarcely realised afterwards, by defeating Scatwell, who had retired into winter quarters with the reputation of being the best two-year-old, and six others for the Column Produce Stakes (£758). But the most interesting event at the meeting was the Severals Stakes (£427) for three-year-olds over the Rous Course (5 fur.). This was won by Mr. S. B. Joel's h. c. Syndrian, by Sunder—Polkerris, who subsequently firmly established himself as a champion sprinter. Not in the first three was Lady James Douglas's Gainsborough, a colt that was destined during the next few months to make equine history. A hard bay, by Bayardo—Rosedrop, the horse had been generally voted as one of the handsomest and most truly formed two-year-olds, but he was backward then. In the Two Thousand Guineas (£5,100), decided on May 1, both Polyscope, a horse trained by E. Loates, and very highly tried, and Scatwell were better favourites than Gainsborough, who started at 4 to 1 in a field of thirteen. He was ridden by J. Childs (who rode him in all his races) and won by a length and a half from Major Astor's Blink, also trained at Manton, Rockavage being another six lengths away. This was the first classic race ever won by a lady owner in her own name. Two days later Lord Derby won the One Thousand Guineas (£4,100), with Ferry, a bay filly by Swynford—Gondollette, ridden by a colonial jockey, B. Carslake. The latter, who had been discharged or invalided out of the army, subsequently proved one of the finest horsemen of the

day, his firmness in handling horses of an uncertain temperament being one of the features of his riding. Behind Ferry, whose victory was so little anticipated that she started at 50 to 1, was the Manton trained My Dear (belonging to Mr. Cox, who under the assumed name of Mr. Fairie, won the Two Thousand Guineas and the Derby the previous season with Gay Crusader), and Benevente. The last named, a brilliant performer as a two-year-old, was generally accepted as the best of her sex and age, but she went wrong during this race, and afterwards developing waywardness was never again of much account. Subsequent running proved that Ferry's success was a pronounced "fluke."

Such an impression was caused by Gainsborough in the Two Thousand Guineas that, when he formed one of a field of thirteen for the New Derby (£4,000) on June 4, 13 to 8 was the best price obtainable about him, and he won by a length and a half from Blink, Sir W. J. Tatem's (afterwards Lord Glanely) chestnut Treclare being third. Only two horses opposed Gainsborough for the Newmarket Gold Cup (£960) at Newmarket Second Extra Meeting in June, and over the two-mile course he beat Planet by half a length, although giving away 3 lbs. of the weight-for-age allowance, in order to permit of Childs riding. The colt's next appearance was in the September Stakes (the substitute St. Leger), (£3,350), over a mile and three-quarters. There were five runners, and 11 to 4 was laid on Gainsborough, who won easily by three lengths from My Dear, with Prince Chimay another four lengths away, Zinovia being fourth and Ferry a long way last. It was an extraordinary circumstance that the first three were all trained at Manton (such a thing had never happened in connexion with the St. Leger) whilst it was the second year in succession that Taylor had turned out the winners of the three colts' classics, and Lady Douglas became the first lady owner to secure the three events. Gainsborough's three-year-old career was destined to end badly, however, for in the Jockey Club Stakes (£4,343) on Oct. 3, with 11 to 2 laid on his chance, he was unaccountably beaten a length by Prince Chimay, who was receiving 3 lbs. Subsequent running of Prince Chimay with My Dear proved that that form must have been all wrong, and a few days after the Jockey Club Stakes it was found that Gainsborough was suffering with a high temperature. The probability is that at his best he was well ahead of all the three-year-olds in a very fine season.

There is no getting away from the fact that My Dear was the best of the three-year-old fillies, and she improved so much as the season advanced, that hopes were entertained that at four years she may hold her own with the colts. A bay, by Beppo—Silesia, she started the season by running second to Ferry for the One Thousand Guineas. She was the heroine of a most sensational race for the Oaks (£3,400), for which she started favourite at 3 to 1, but was beaten a length by Mrs. Arthur James's Stony Ford, Ferry and Silver Bullet running a dead heat behind the pair. Donoghue, who was on My Dear, lodged an objection against J. H. Martin, the rider of Stony Ford, for bumping and boring, and this being upheld, My Dear got the race. There is no doubt, however, that on that afternoon Stony Ford was a very good filly, though probably the mile and a half was quite as far as she cared to gallop. My Dear next

carried off the Midsummer Stakes (£470) in July, Freesia (received 14 lbs.) and Violinist (received 11 lbs., favourite), being second and third, beaten six lengths and four lengths. After running second to Gainsborough for the September Stakes Mr. Cox's filly beat Roideur (received 14 lbs.), Ferry (received 1 lb.), Scatwell (received 14 lbs.), and Jessin (received 26 lbs.) in a Triennial in October. The Champion Stakes (£950) was her next outing, and with odds of 11 to 10 laid on, she finished the mile and a half three lengths and half a length ahead of the four-year-olds Dansellon and Diadem (who were eased), Prince Chimay, the other runner, being beaten off. This victory was followed by an easy one two days later in the Lowther Stakes (£490). My Dear, like Gainsborough, was trained by Taylor, and was ridden in all her races by Donoghue.

With the season so drastically curtailed the older horses had not many opportunities, but some smart performances were accomplished by Diadem, Phalaris, and Hainault. In the Bretby Handicap (£342), at the First Spring Meeting, over 6 furlongs, the first-named gave lumps of weight to horses of all ages, and in Whit-week, at Manchester, she repeated the performance in the Salford Borough Handicap (£925), Irish Elegance, a very smart three-year-old sprinter, who finished third, being in receipt of 38 lbs. Perhaps that was the best performance of Lord d'Abernon's mare. Lord Derby's Hainault scored his first success of the year at Stockton in April, carrying off the Spring Handicap of a mile and a half (£216) from nine opponents, with the weight of 9 st. 3 lb., giving weight a 1 round, and although he ran several times without actually hitting the mark he invariably put up a very fine performance. The five-year-old Phalaris stamped himself as the greatest sprinter of the season. In the Abingdon Plate (£177), in May, he conceded Syndrian 18 lbs. for the two years between them, and won by half a length. That was over a mile, as was the June Stakes (£580) at the First Extra Meeting, in which he beat Planet (received 2 lbs.), Bapaume (received 24 lbs.) and Brown Prince (received 2 lbs.). In the Lanwades Plate (£177), over 7 furlongs, at the Second July, he, with 10 st. 11 lb. up, won from eight opponents. Phalaris won all his races smoothly.

The two-year-olds, at first thought to be of high class, turned out to be only an average lot. The best were probably Bruff Bridge, by Bridge of Earn, dam by Lesterlin, Buchan by Sunstar—Hamoaze, Polygnotus by Polymelus—Ornamental, Monte Faro by Fariman—Craggy, Paper Money by Greenback—Epping Rose, Dominion by Polymelus—Osyrua, and Stefan the Great by The Tetrarch—Perfect Peach. Up to the end of October Bruff Bridge won four races out of six. In the May Plate (£290) at Newmarket First Spring Meeting, he beat twelve opponents very easily, of whom Propagation and Dame Evè were the best. In the Somerville Stakes (£412) at the Second Spring Meeting, he defeated thirteen opponents, and won by half a length from Propagation (received 5 lb.), Coryphee (received 8 lb.) being third. In winning the New Coventry Stakes (£1,550) in June he beat three good ones in Monte Faro, Dominion and Galloper Light amongst others, but only got home by a neck, and a fortnight later was beaten in the Exeter Stakes by the colt by Cicero—Signorinetta, who was in receipt of 8 lb. Dominion was third.

Bruff Bridge made amends by winning the Rous Memorial Stakes (£887) in October, but he had little to beat. In the Middle Park Plate he could only finish behind Stefan the Great (who in his only previous outing had won a Triennial in which he beat nothing of high class), Knight of Blyth, Dominion and Lord Basil. There may have been something amiss with Bruff Bridge, for he was not backed as though fancied.

Buchan won the Spring Two-Year-Old Stakes (£537) at Newmarket Second Spring Meeting from a dozen opponents, of whom the best were, perhaps, Viceroy and Beekhampton, and opposed only by Starshot and Splendid Spur carried off the July Stakes (£1,200) by a short head. Buchan also won the Chesterfield Stakes (£1,067), beating Dominion by a head after a bumping finish, which led to an objection that was over-ruled; but in the Clearwell Stakes at the end of October he was only third to Glacier filly (received 12 lb.) and Silonyx (received 9 lb.). By the end of October Polygnotus had won four races out of six. He ran nowhere behind Monte Faro in the First Spring Two-Year-Old Stakes, but at Newmarket during Whitsun week secured the Northern Two-Year-Old Stakes from seven opponents very easily. At Newmarket in September he was fourth to Alliance (received 10 lb.), Roseway (received 2 lb.), and Queen of the Ballet (received 15 lb.), for the Barton Mills Nursery. A very easy win over Silonyx, Manilardo and two others in the Boscawen (Post) Stakes (£500) followed, supplemented by a success in a big field which included Valley, Faïnone Geal colt, Fourboire and Pretty Missie (many of them good winners) in the Suffolk Nursery (£702). The colt then won the Prendergast Stakes (£960) from several useful juveniles, to all of whom he was conceding weight. That sums up the most important two-year-old form, and from it one might draw the deduction that Stefan the Great was as good, perhaps better, than any of them.

For the fifth year in succession the list of the winning jockeys was headed by Steve Donoghue, who had 270 mounts and rode 66 winners. The Australian, B. Carslake, was second with 204 mounts and 42 winners, and F. Fox was third with 252 mounts and 30 winners. In connection with winning owners the feature was that the first four in the list all trained at Manton. They were Lady James Douglas, 2 winners of 5 races, value £24,735; Mr. S. B. Joel, 9 winners, 21 races, value £9,762; Mr. W. M. Catzalet, 5 winners, 12 races, value £9,416; Lord Derby, 7 winners, 11 races, value £7,450. Once more Alec Taylor was the leading trainer. He prepared the winners of all the classic races (except the One Thousand), the Princess of Wales Stakes, the Jockey Club Stakes, the Newmarket Gold Cup, the Jockey Club Cup, and the Cesarewitch. He sent out 14 horses that between them secured 33 races of the value of £36,629. The Hon. George Lambton came second with 14 winners, 22½ races, £11,768; and Sam Loates was third with 9 winners, 9½ races, £9,765. Lady James Douglas was the most successful breeder of blood stock, 6 from her stud winning 9 races of the value of £15,980. Her colt Gainsborough secured 4 races worth £13,410, and the next two most successful horses of the year were Prince Chimay, 3 races, £5,968, and My Dear, 5 races, £5,702. Of the sires, Bayardo (dead), 6 winners, 8 races, value £15,650; Polymelus, 14 winners, 23 races, £12,198; Sunstar, 13 winners, 16 races, £10,575, did best.

[During the war some of the prohibitions hereinafter referred to have been temporarily relaxed: particulars to be obtained from the several central or local authorities.]

CLOSE SEASON FOR GAME, WILD BIRDS, &c.

It is illegal to pursue the different kinds of game between the following dates (inclusive):—

GAME.	ENGLAND.	SCOTLAND.	IRELAND.
Black Game or Heath Fowl.	11 Dec. to 19 Aug. (31 Aug. in Somerset, Devon, and New Forest).	11 Dec. to 19 Aug.	11 Dec. to 19 Aug.
Bustard	2 Mar. to 31 Aug.	None.	11 Jan. to 31 Aug.
Deer, Male.	None.	None.	1 Jan. to 9 June.
„ Fallow Male.	None.	None.	Michaela. to 9 June.
*Grouse or Red Game.	11 Dec. to 11 Aug.	11 Dec. to 11 Aug.	11 Dec. to 11 Aug.
*Hare	None.	None.	20 Apr. to 12 Aug.†
*Heath or Moor Game.	None.	As “Muir-fowl.”	11 Dec. to 11 Aug.
Landrail, Quail.	As “Wild Birds.”	As “Wild Birds.”	11 Jan. to 19 Sept.
*Muirfowl, or Ptarmigan.	None.	11 Dec. to 11 Aug.	11 Dec. to 19 Aug.
*Partridge.	2 Feb. to 31 Aug.	2 Feb. to 31 Aug.	2 Feb. to 31 Aug.
*Pheasant.	2 Feb. to 30 Sept.	2 Feb. to 30 Sept.	2 Feb. to 30 Sept.

† Subject to variation in various counties: e.g., Tyrone, 1 Apr. to 12 Aug.; Dublin, 1 Mar. to 20 Sept.

It is also unlawful to kill the game marked * on a Sunday or Christmas Day.

In England hares, rabbits, woodcock, snipe, quail, landrail, and heath or moor game (and the eggs of swan, wild duck, teal, and widgeon) are protected under the Game Laws, though no close-time is fixed for them by those laws. In Scotland the same remarks apply to deer and hares, to the first four birds, and to wild duck; in Ireland to all these five birds, with the further addition of widgeon, teal, and plover. The close-time for all these birds (except quail and landrail in Ireland, for whose close-time see above) is, under the Wild Birds Protection Acts, 1880 to 1908, from 2 March to 31 July, both inclusive. Otherwise this close-time applies to all wild birds throughout the United Kingdom. The penalty for killing any wild bird in such close-time, or for selling or having in possession between 16 March and 31 July, both inclusive (unless the killing can be proved to have occurred at a time and place to which the Act does not apply), is a reprimand and costs for the first offence, and 5s. and costs for each bird for every subsequent offence, or, in the case of the undermentioned birds, £1 for each bird for each offence. In any case the Court may also order the forfeiture of any bird (or eggs, where protected—see next column) in respect of which the offence was committed. In the Island of St. Kilda the fork-tailed petrel and St. Kilda wren are deemed to be included in the following list, and the birds marked † to be omitted.

American quail.	Kittiwake.	Scout.
Auk.	Lapwing.	Sealark.
Avocet.	Lark.	Seamew.
Bee-eater.	Loon.	Sea parrot.
Bittern.	Mallard.	Sea swallow.
Bonxie.	Marrot.	Shearwater.
Colin.	Merganser.	Sheldrake.
Cornish chough.	Murre.	Shoveller.
Coulteneb.	Night-hawk.	Skua.
Cuckoo.	Night-jar.	Sniew.
Curlew.	Nightingale.	Snipe.
Diver.	Oriole.	Solan goose.
Dotterel.	Owl.	Spoonbill.
Dunbird.	Ox-bird.	Stint.
Dunlin.	Oyster-catcher.	Stone curlew.
Eider-duck.	Peewit.	Stonehatch.
Fern-owl.	Petrel.	Summer snipe.
† Fulmar.	Phalarope.	Tarrock.
† Gannet.	Plover.	Teal.
Goatsucker.	Ploverspage.	Tern.
Godwit.	Pochard.	Thicknee.
Goldfinch.	† Puffin.	Tystey.
Grebe.	Purre.	Whaup.
Greenshank.	† Razorbill.	Widgeon.
† Guillemot.	Redshank.	Wild duck.
Gull (except black-backed).	Reeve or Ruff.	Willock.
Hoopoe.	Roller.	Wimbrel.
Kingfisher.	Sanderling.	Woodcock.
	Sandpiper.	Woodpecker.

Offenders refusing their names and addresses are liable to a further penalty of 10s., but the Acts do not apply to any person shooting on his own land, or authorising anyone so to shoot, any wild bird not included in the above list.

On the application of the local authorities, the Secretary of State in England and Wales, the Secretary for Scotland in Scotland, or the Lord Lieutenant in Ireland, has power to vary or abolish the close-time for any bird or birds in any county by order to be published in the *Gazette*. They may also direct that the above enactments shall apply to any wild bird not specified in the list, and may further prohibit the taking of the eggs of any wild bird in any county or part thereof. The Secretary of State in England and Wales, or the Secretary for Scotland, may also on the application of the local authorities make an order providing that in any specified area the taking or killing of any particular kinds of wild birds shall be illegal during any period specified in the order. These various powers have been exercised in many cases—too numerous to recapitulate here.

Penalties are imposed on persons setting springs, gins, &c., on poles, trees, mounds, &c., so as to injure wild birds. Persons permitting such acts are equally liable. The use of a hook or like instrument for taking wild birds is forbidden.

HUNTING AND GROUND GAME.

There is no statutory close-time for fox-hunting or rabbit-shooting, nor is there, except in Ireland, for deer or hares; but there is an “unwritten law” which the sportsman respects as much as he does the enactments of Parliament. 1 November is the recognised date for the opening of the fox-hunting season, which continues till the following April. Otter-hunting lasts from mid-April to mid-September. The period for deer-hunting or stalking varies from about 12 Aug. to 12 Oct. for stags, and from 20 Nov. to the end of March for hinds. By an Act passed in

1898 the sale of hares or leverets in Great Britain is prohibited from March to July inclusive under a penalty of a pound. This does not apply to foreign hares. The statutory close season for hares in Ireland has been varied for some counties by order of the Lord Lieutenant, and it is now mostly from 1 April to 12 August.

CLOSE-TIME FOR SALMON.

I. ENGLAND AND WALES (including the Esk in Dumfries). The close time for salmon (including all migratory fish of the genus salmon) begins, for nets, on 1 Sept., and for rods on 1 Nov.; for both nets and rods it ends on 1 Feb. For putts and putchers the annual close season is from 1 Sept. to 1 May. By an Act of 1907 the Board of Agriculture and Fisheries may make provisional orders varying the law on these and other points. The close-time may also be varied by bye-law by local boards of conservators, provided it begins for nets not later than 1 Nov., with a minimum of 154 days, and for rods not later than 1 Dec., with a minimum of 92 days. The statutory dates have been varied as follows:—

Close-time for	Nets.	Rods.
Adur	1 Sept. to 1 Feb.	1 Oct. to 1 Feb.
Hamshire††	31 July to 1 Feb.	1 Oct. to 1 Feb.
Severn§§§	16 Aug. to " "	" "
Wye	" to " "	16 Oct. to "
Taff and Ely..	31 Aug. to 30 Apr.	15 Nov. to 30 Apr.

Powey	11 Nov. to "	" "

* Except above Woodbury Road Station, 1 Sept. to 15 April. † Above S. Biddick. ‡ Below Old Sandsfield for nets. For rods these dates do not apply in R. Eden above Irthing Foot, or in R. Eamont. § Below Lostwithiel only. ¶ Except R. Erme, 30 Sept. (rods 30 Nov.) to 4 April. §§ 1 June to 1 Feb. above Tewkesbury Weir. ** 16 Aug. to 16 April for putts and putchers. †† Above Lostwithiel, 1 Dec. to 1 April. ‡‡ East of Needles Light-house the dates are:—For nets, 1 Sept. to 24 Feb.; for rods, 16 Oct. (Beaulieu Manor, 31 Oct.) to 1 Feb.

No fresh salmon may be sold between 3 Sept. and 1 Feb., except such as come from parts beyond the seas, or as have been taken, if in the United Kingdom, by legal netting. During that period all packages containing salmon consigned by any common or other carrier must be clearly marked with the word "Salmon." Salmon, dried, pickled, or cured abroad, or, if within the United Kingdom, between 1 Feb. and 3 Nov., may be sold after that date. The onus of proof that the fish were caught out of the United Kingdom, or, if within the kingdom, that they were caught during the legal netting season by legal means, or that, if pickled, they were pickled between 1 Feb. and 3 Nov., lies with the person selling or exposing for sale. The exportation of salmon from any part of the United Kingdom is prohibited between 3 Sept. and 30 April, unless caught at a time at which its sale in the place where it was caught would be legal, if in the United Kingdom: the *onus probandi* lies on the person exporting. The capture and sale of "unclean" salmon, i.e., salmon recently spawned or full of spawn, are prohibited under heavy penalties. Roe may not be used as a bait in salmon angling.

Net-fishing for salmon is prohibited in England and Wales from noon Saturday to 6 a.m. Monday. This has been varied by conservancy boards in most districts, and extended to 48 hours, with certain changes in the hour of commencement.

II. SCOTLAND (exclusive of the Esk in Dumfries). The annual close-time must not be less than 168 days. It is, for nets, 27 Aug. to 10 Feb., and, for rods, 1 Nov. to 10 Feb., except as follows:—

Close-time for	Nets.	Rods.
Tay*	21 Aug. to 4 Feb.	16 Oct. to 14 Jan.*
Add, Aray, Eckkaig, N. & S. Esk, Fyne, Ruel, Shira	1 Sept. to 15 Feb.	1 Nov. to 15 Feb.
Conon	—	16 Oct. to 25 Jan.
Awe, Beaulieu, Spey, Dunbeath, Lossie	—	16 Oct. to 10 Feb.
Halladale, Strathly, Naver, Borgeie, Helmsdale, Brora, Hope, Polla	—	1 Oct. to 10 Jan.
Forth	—	1 Nov. to 31 Jan.

* Except Earn, rods, 1 Nov. to 31 Jan.

The weekly close-time for nets is between 6 p.m. Saturday and 6 a.m. Monday; and, for rods, on Sundays.

In Scotland the law as to the sale of salmon differs somewhat from that in force in England.

III. IRELAND. The close-time applies to both capture and sale of salmon and trout. The netting close-time must never be less than 168 days, but many variations have been made, which it is impossible to specify in detail here; the following list shows the general close-time (all dates inclusive) in force in the various districts, in parts of some of which, however, it is different. The second column gives the point of delimitation on the coast between the districts, which include all rivers, &c., within the respective coast-limits.

District.	Coast Limits.	Cl.-T. Net.	Cl.-T. Rod.
Dublin.....	Skerries	16 Aug. to 1 Feb.	1 Nov. to 31 Jan.
Wexford ..	Wicklow	16 Sept. to 31 Mar.	1 Oct. to 14 Mar.

Dundalk ...	Donaghadee ...	13 Aug. to 11 Feb.	16 Oct. to 29 Feb.
Drogheda .	Clogher Head .	Do. ...	16 Sept. to 11 Feb.

In Ireland the weekly close-time is fixed at 48 hours, commencing 6 a.m. Saturday.

CLOSE-TIME FOR TROUT AND CHAR.

The capture of trout and char in England and Wales is prohibited between 1 Oct. and 1 Feb., except (1) in the Thames and Lee, where the close season is from 11 Sept. to 31 March; and (2) in the cases noted below, where, under an Act of 1876, the close-time (for rods and nets, except where specified) has been varied by bye-law by local boards of conservators. In the districts marked * the close-time, as altered, applies only to trout. The sale of trout and char is absolutely prohibited throughout England and Wales from 2 Oct. to 1 Feb. :—

*Eden	2 Sept. (rods 2 Oct.) to 29 Feb.
*Urk	2 Sept. to 14 Feb. †
Tyne	1 Oct. to 21 Mar.
*Wye	2 Oct. to 14 Feb.
*Taff & Ely	20 Sept. to 1 Feb.
*Cleddy	29 Sept. to 1 Mar.
*Ogmore	30 Sept. to 29 Feb.
*Teign	1 Oct. to 2 Mar.
*Exe	15 Sept. to 29 Feb.
*Selout†	22 Sept. to 21 Feb. (except Anglesey, 13 Feb.)

Derwent (Cumb.) ... Except Char in Crummock and Buttermere, 1 Nov. to 30 June.

W. Cumberland Telfy, *Avon (Devon), Conway ... 1 Oct. to 29 Feb.

Norfolk † ... 1 Oct. to 29 Feb.

Yorks	2 Oct. to 1 Apr. **
*Suffolk & Essex	2 Oct. to 10 Apr.
*Dee	14 Oct. to 14 Feb. (rods only).
*Coquet	1 Nov. to 3 Mar. (ditto).

In Scotland there is a close-time for trout from 15 Oct. to 29 Feb. In Ireland the close-time for trout is the same as for salmon. For pollen the close-time is from 14 Nov. to 31 Jan.

Between Sept. 3 and Feb. 1 all packages in England and Wales consigned by any common or other carrier and containing trout or char must be distinctly marked with the word "Trout" or "Char," as the case may be.

CLOSE-TIME FOR FRESHWATER FISH.

By the Freshwater Fisheries Act, 1878, a close-time for catching, selling or buying "freshwater fish" (which are defined for this purpose to include all kinds of fish, other than pollen, trout, and

† River Avon between Amesbury and Bickton only; above Amesbury 15 Oct. to 31 Mar.

§§ 19 April 30 between Lostwithiel and St. Winnow. ¶ 2 Oct. to 30 June from R. Gwili to G.W.R. Bridge.

¶ 2 Oct. to 14 Mar. in certain reservoirs. ** Or Thursday preceding Good Friday, whichever date is the earlier.

†† In area of Norfolk Fisheries Provisional Order only; elsewhere in Norfolk close-time for nets 10 Sept. to 25 Jan.

char, which live in fresh water, except those kinds which migrate to or from the open sea) is fixed from 15 March to 15 June, both inclusive, for England and Wales except small parts of Norfolk and Suffolk, under a penalty of £2 for a first and £5 for a subsequent conviction. The close-season, however, does not apply to eels taken otherwise than by angling; or to freshwater fish other than grayling taken in certain private waters by leave of the owner; or to angling in public waters by leave of a board of conservators, or in private waters by leave of the owner; or to taking fish in certain cases for bait or for scientific purposes. Fishery districts may be wholly or partially exempted from this close-time with the sanction of the Board of Agriculture and Fisheries. The Axe, Avon (Devon), Wye, Eden, and Towy districts have been so exempted; also the Kent and Bela and Severn as regards pike; the Usk as regards eels; and parts of the Severn as regards fish other than grayling. For eels a separate close-time exists (so far as regards fixed engines in salmon rivers) in England from 1 Jan. to 24 June; in Ireland, with one or two exceptions, from 11 Jan. to 30 June. In the Severn, elvers, or eel fry, are protected between 1 Jan. and the last day of Feb., and between 15 May and 30 June. Certain other local close-times exist for freshwater fish, under local Acts or bye-laws.

PROTECTION OF CRABS AND LOBSTERS.

Under the Fisheries (Oyster, Crab, and Lobster) Act, 1877, it is prohibited to buy or sell crabs under $4\frac{1}{2}$ inches, measured across the largest diameter of the back, or lobsters under 8 inches, measured from tip of beak to end of tail when spread out flat. The capture of "soft" crabs and crabs with spawn is also prohibited. By local bye-laws of Sea Fisheries Committees (*vide infra*), the minimum size of lobsters and crabs

that may be lawfully taken in different parts of the territorial seas has been increased, and in some cases the taking of lobsters with spawn is prohibited, or a close season fixed.

CLOSE-TIME FOR OYSTERS.

There are also local regulations for the protection of oysters; and by the Fisheries (Oyster, Crab, and Lobster) Act, 1877, a close-time for the capture and sale of "Deep-Sea Oysters" is fixed for England and Scotland, but not for Ireland, from 15 June to 4 Aug.; and for all other kinds of oysters—except oysters taken in the waters of a foreign state—from 14 May to 4 Aug. By the Sea Fisheries Act, 1868, fishing for oysters is prohibited from 16 June to 31 Aug. in the English Channel between lines drawn (1) from North Foreland to Dunkirk, and (2) from Land's End to Ushant—the territorial seas of England and France being excepted. This close-time, however, cannot be enforced till the Convention between England and France, included in the Act, is ratified; until that is done, the Convention concluded in 1839, which prohibits oyster-fishing in those limits from 1 May to 31 Aug., remains in force so far as French fishermen are concerned. But both Powers usually agree to suspend the close season till 16 June in each year. In Ireland, taking oysters from licensed beds is larceny; and by 5 & 6 Vict. cap. 106, no oysters may be taken between 1 May and 1 Sept., though this close-season has been varied in the following cases:—

Estuary of Suir.....	1 Jan. to 30 Sept.
Tralee Bay	1 Mar. to 30 Sept.
Galway Bay and Carlingford Lough	1 Jan. to 30 Nov.
Strangford Lough	1 Mar. to 31 Aug.
Achil Sound, Clew Bay.....	2 April to 30 Sept.
Sligo, Ballisodare and Drumcliffe Bays	1 May to 31 May.

Licences for Shooting and Fishing.

GAME AND GUN LICENCES.—A licence is required by every person who hunts, shoots, or takes game, except persons (in Great Britain) taking woodcock and snipe with nets or springes; rabbit-warren proprietors, or others, on enclosed land, killing rabbits; persons hunting deer, or hares, with hounds; or owners or occupiers, or their servants, killing deer on their own land; beaters and others, not holding guns, attending holders of game licences. Occupiers of enclosed land, or owners, having the right to kill game, may themselves kill hares, or authorise others to do so, without a licence, but such authority must be limited to one person at a time in any one parish, and must be registered with the clerk of the Justices of the Petty Sessional Division in which the land is situate. Even when the quarry is not what is legally known as "game," a "gun" licence is necessary. A game licence, however, covers a gun licence. Soldiers, sailors, volunteers, or constables, on duty, or at practice, need not take out a gun licence, nor need occupiers of land scaring birds or killing vermin on such land, or persons so acting under the orders of occupiers holding a licence. Unless, however, the occupier is himself licensed, he cannot authorise any unlicensed person to carry a gun. "Scaring" birds is not to be regarded as including killing of any birds, and "vermin" does not include rabbits. The rates of duty are given at p. 726.

FISHING LICENCES.—In all fishery districts in England and Wales, and in Ireland, a licence

to fish for salmon is necessary, and in most English and Welsh rivers a similar licence is necessary for trout or char, except that a salmon licence includes the latter. In the Lune, Derwent, Severn, and Wye licences for "freshwater fish" are in force. In Scotland no licence is needed. A licence is available only in the district, and for the season, in which it is issued, except that in Ireland rod licences are available in all parts of that country. The rates on salmon nets and other like instruments range from £20 downwards in England and Wales, and from £30 downwards in Ireland. In the latter country the rate on draft nets, the kind most commonly used, is £3; in England and Wales it varies from £5 to £2. The licence duty on a salmon rod and line is £1 in Ireland. In England and Wales different rates are charged in different districts as follows (an asterisk signifies that lower rates of duty are chargeable for short periods, or for certain parts of the district):—

*Dee, 40/-; *Eden, *Derwent, *Exe, Hampshire, *Wye, *Usk, 30/-; Taw and Torridge, 24/-; *Lune, *Ribbles, Clwyd & Elwy, *Conway, *Dovey, *Teify, Avon (Devon), *Dart, *Teign, Frome, Stour (Kent), *Yorkshire, *Tees, *Tyne, 20/-; *Dwyfach, Towy, 21/-; *Seint, Avon, Brue & Parret, *Camel, *Fowey, 15/-; Cleddy, Taif & Ely, Ockmore, W. Cumberland, 10/6; *Kent & Leven, Rhymney, *Ayr, Severn, Axe, Trent, Tamar & Plym, 10/-; *Esk (Yorkshire), 7/6; Ouse (Sussex), Wear, Coquet, Cuckmere, Rother, Adur, 5/..

ENGLAND AND WALES.—The administration of the laws of close season, &c., for salmon and freshwater fish is placed by the Salmon and Freshwater Fisheries Acts, 1861 to 1907, and the Board of Agriculture and Fisheries Act, 1903, in the hands of local boards, with the Board of Agriculture and Fisheries as the central author-

qualified by ownership of lands or fisheries of a certain value; and representative members, elected annually by persons who have paid licence duty on instruments other than rod and line for salmon fishing in public waters. In certain cases, under local Provisional Orders, there are also members representative of fresh-

ity. Districts may be formed and Boards of Conservators appointed, and the following districts have been formed, including generally all rivers running into the sea between the points named. Except in the cases marked + they also include the sea for three miles from the shore, or to the mid-channel in estuaries.

These Boards of Conservators consist mainly of three classes of members—those appointed annually by the Councils of the various counties through which the rivers flow; *ex-officio* members,

water anglers. Districts where Provisional Orders are in force are marked thus *.

There are also certain bodies created by local statutes, having authority over the fisheries, *e.g.*, the Thames Conservancy Board, Port of London Authority, Lee Conservancy Board, and Conservators of the Medway.

The above-mentioned Boards have power to make bye-laws, not only for the regulation of the fisheries for salmon and freshwater fish, but also, in certain cases, for the regulation of other

kinds of fishing which are prejudicial to such fisheries. They are also empowered to issue licences for fishing for salmon, trout, and in some cases freshwater fish generally.

SCOTLAND.—In Scotland there are 105 Fishery Districts, nearly each separate river forming a district of itself, but only 37 Boards of Conservators. The powers of these Boards are limited to the Salmon Fisheries.

IRELAND.—In Ireland there are 24 districts, embracing between them the whole country, each with a separate Board of Conservators (*see p. 721*).

SEA FISHERIES DISTRICTS.—Under the Sea Fisheries Regulation Acts, 1888 to 1894, the Board of Agriculture and Fisheries has power to form sea fisheries districts within the territorial waters of England and Wales, and to constitute local Fisheries Committees, either for a single county or borough, or for several jointly. These Committees have power to make bye-laws, to be confirmed by the Board of Agriculture and Fisheries, regulating or prohibiting the use of

instruments for the capture of sea fish (including shell fish and crustaceans, but excluding salmon), the deposit of rubbish on fishing grounds, &c. The following districts have been created, including in each case the adjoining coast and territorial seas between the points respectively mentioned:—
1. Northumberland (coterminous with that county). 2. North Eastern, from Northumberland to Donna Nook in Lincolnshire. 3. Eastern, Donna Nook to Yarmouth. 4. Kent and Essex, Dovercourt to Dungeness, including the Thames estuary to London Stone near Yantlet Creek. 5. Sussex (coterminous with that county). 6. Southern, Western boundary of Dorset to Hayling Island. 7. Devon, and 8. Cornwall (each coterminous with the respective counties). 9. South Wales, Eastern boundary of Cardiff to Cemmaes Head. 10. Lancashire and Western, Cemmaes Head to Haverigg Point. 11. Cumberland, Haverigg Point to Sark Foot.

Similar districts may be formed in Scotland under the Sea Fisheries Regulation (Scotland) Act, 1895.

Seasonable and Unseasonable Fish.

THE following table shows the periods when the different kinds of edible fish mostly in use are "in season" and "out of season."

The letter *p* signifies that the fish are then

in their prime or most plentiful; the letter *x* signifies that the fish may be obtained, but are not at their best; the letter *c* signifies that it is "close-time" as fixed by statute.

(a) This is for sea crayfish (or crawfish). River crayfish can be obtained in the summer and autumn. It is illegal to take fresh-water crayfish from March to June.

(b) Foreign oysters can be sold in the close season, and are to be had almost all through the year, even though they have been laid down in English beds for temporary storage.

(d) In the close season, salmon from Holland, and also from certain British rivers where net fishing is permitted later in the year than usual, are largely sold.

(e) For the first six months the bulk of our London supply of shrimps comes from Holland, but Dutch shrimps are far inferior to the English, which are plentiful from July to December.

Metropolitan Water Board, 1918-19.

(For list of Officials, see Government and Public Offices, p. 209.)

Members, 66. The Fourth Board go out of office on June 1, 1919.

Area, 558 square miles.

Charges, Domestic, 5 per cent. on rateable value.

Net Water Rental (Approximate), £2,953,570.

Capital Debt of Board on April 1, 1918—£49,878,455; interest, £1,546,914.

Population supplied (Estimated), 6,783,303.

No. of Services, 1,131,200.

Storage, 1,982 acres; total capacity in million gallons, 12,907.

Supply, Annual, 94,431 million gallons; average daily, 259 million gallons.

Constitution.—The Metropolitan Water Board came into existence in 1903 under the provisions of the Metropolitan Water Act, 1902.

The fourth Board was elected in June, 1913. In view of the war, the Local Government Board postponed the triennial appointment of a new Board for another year.

There are on the fourth Board 14 original members of the Board first appointed in 1903.

Area.—The County distribution of the Board's statutory area is as follows:—

	sq. miles.	acres.
London	116	576
Essex	107	56
Hertford.....	23	556
Kent	159	82
Middlesex	97	431
Surrey	55	160

Total..... 558 1,861
Capital Debt.—The capital debt of the Board as at April 1, 1918, was:—

		Interest.
(i) Metropolitan Water		
(A) Stock	£6,060,165	£181,805
(ii) Metropolitan Water		
(B) Stock.....	£35,045,640	£1,051,369
(iii) Redeemable De-		
benture Stocks	£7,217,838	£216,910
(iv) Mortgage Loan	£312,000	£16,350
(v) Metropolitan Water		
Board Bills	£1,242,812	£80,480
	£49,878,455	£1,546,914

In addition to the annual interest, the Board are under obligations to pay Annuities and Rent Charges amounting to £7,900.

Sources of Supply.—The Board's supply of

water is derived from the Rivers Thames and Lee, gravel beds near the Thames, the Chadwell Spring—which is the beginning of the New River—and wells sunk in the Lee Valley on the north of the Thames, in Kent, and certain other points south of the Thames.

The Board's supply (direct and in bulk to adjacent undertakings) during the year was 94,431 million gallons, or a daily average of 258·71 million gallons. The grand total volume is equivalent to 421·5 million tons of water. The Thames furnished 58·3 per cent., the Lee 23·6 per cent., and the wells, &c., 18·1 per cent. of this total.

Population.—The total estimated population directly supplied by the Board at the close of the year was 6,783,303, representing a decrease of 4,043 during the year, or '06 per cent. Of this total 4,408,553, or 65 per cent., reside north of the Thames, and 2,374,750, or 35 per cent., south of the river.

Daily Supply per head.—The daily average supply per head was 37·83 gallons, compared with 36·84 gallons in 1916-17.

Storage.—The effective amount of storage and subsidence reservoir capacity for unfiltered water possessed and in use by the Board at the end of the year was as follows:—

	No.	Acres.	Million gallons.
Thames Valley ...	31	1,026·5	7,267·5
Lee Valley	17	955·0	5,639·5
Total	48	1,981·5	12,907·0

Comparison of Works.—The following table shows at a glance the increases which have taken place under the Board in the active equipment of the waterworks since the transfer of the undertakings:—

	Before June, 1904.	At March 31, 1918.
Storage reservoirs for un-		
filtered water	44	48
Acreage	843	1,981·5
Capacity in million gallons	4,115·7	12,907·0
Service reservoirs for filtered		
water	75	86
Capacity in million gallons	244·5	310·9
Filter beds	137	172
Acreage	139	170·7
Engines	235	280
Horse-power	32,177	43,252
Miles of water pipes	5,759	6,480

STATE CONTROL OF COAL.

THE Government has now full control of the coal mines of the United Kingdom. Following upon a threatened strike in the South Wales coalfield on a question of wages, an Order in Council was made operative as from 29 Nov., 1916, giving the Board of Trade possession of the coal mines in the affected area. From one coalfield to the control of all was only a step, and after some agitation amongst the miners a further Order in Council was made on 22 Feb., 1917, to apply to all coalfields in the country. Mr. Guy Calthrop was appointed Controller.

The terms of settlement, notwithstanding long negotiations between the Government and

the Mining Association and Coal Owners, have not been arrived at satisfactorily. Conditions vary in the various coalfields so much that a flat rate is not considered fair. Parliament has taken the arrangements under consideration, and basis of the compensation to the mine-owners was put in the direction of the continuance of ordinary profits as before the war. In the case of excess, about 80 per cent. of the increased profit is paid over to the State. It should be understood that the nation is not buying the coal mines—it is simply controlling them for the purpose of the war in the same manner as the railways.

All Hallows Barking by the Tower.—In this church took place the christening of William Penn, Quaker, and founder of the State of Pennsylvania. He was born "upon Great Tower Hill, on the east side, with a court adjoining to London Wall," on Oct. 14, 1644, the son of Admiral Sir William Penn, and was admitted a student at Lincoln's Inn on Feb. 7, 1664-5. A tablet to his memory was erected in the church in 1911 by the Pennsylvania Society of New York (see also *Tower of London*). In All Hallows John Quincy Adams, afterwards sixth President of the United States, was married to Louisa Catherine Johnson, daughter of the American Consul in London, on July 26, 1797.

Bunhill Fields Burial Ground, City Road.—Contains the tomb (which, however, cannot now be identified) of Nathaniel Mather, the second son of Richard Mather, the founder of the family from which came Increase Mather, of Boston. He fled with his father to America owing to the severity of the times. To the west of the cemetery is the Friends' Burial Ground, with the grave of George Fox, the Quaker, who went to America in 1671. On the opposite side of City Road is Wesley's Chapel, and behind that the grave of John Wesley, the famous preacher, who, with his brother Charles, in 1735 undertook a mission to Georgia for the Society for the Propagation of the Gospel.

Canonbury Tower, Islington.—Washington Irving resided here, in the room said to have been used by Oliver Goldsmith.

Charterhouse.—Roger Williams, the founder and governor of Rhode Island, was on June 25, 1621, elected a "pensioner" or exhibitor at Sutton's Hospital (the Charterhouse), being the second scholar placed there by Sir Edward Coke.

Cheyne Walk, Chelsea.—Cheyne Walk to Americans will be interesting as containing four houses where James MacNeill Whistler lived at various times. The first was No. 101; at No. 96 he painted the portraits of his mother and of Carlyle, and issued the writ for his famous libel action against Ruskin; and at No. 74 he died on July 17, 1903.

Christ Church, Westminster Bridge Road.—Opened on July 4, 1876, the centenary of American Independence. The Lincoln Tower and Spire, 200 feet high, shows the Stars and Stripes inwrought into the stone and the British lion and the American eagle at the angles of the tower. The cost of the tower and spire, £7,000, was largely defrayed by Americans, in gratitude for Mr. Newman Hall's sympathy with the Union during the Civil War.

Cork Street.—At No. 15 lived George Peabody, who gave £500,000 for the erection of dwelling-houses for the working classes in London. His statue, in bronze, is behind the Royal Exchange.

Craven Street, Strand.—At No. 36 lived Benjamin Franklin, diplomatist and statesman, and his son William. At the bottom of Craven Street runs the Thames, and in this connexion one may recall Franklin's account of his long swim from Chelsea to Blackfriars.

Devonshire House, Bishopsgate.—The headquarters of the Society of Friends, where many important documents relating to William Penn may be seen.

George Street, Hanover Square.—At No. 24 Nathaniel Hawthorne and his family lived in lodgings for a month in 1855. Mrs. Hawthorne is buried in Kensal Green.

Hampstead.—Belmont, Rosslyn Hill, was the

residence of Sir Harry Vane, Governor of Massachusetts. Later on it was tenanted by Bishop Butler, who is said to have written parts of his "Analogy of Religion" here. A tablet of encaustic ware, affixed by the Royal Society of Arts in 1897, states: "Sir Harry Vane, Statesman, lived here. Born 1612. Beheaded 1662." Hampstead Church is also worth a visit. In the octagonal porch, formerly the vestry, may be seen a bronze bas-relief to Henry Coat (1740-1800), the English iron-founder, erected in 1906 by Mr. Charles H. Morgan, an eminent American engineer, in memory of one "to whom the world is indebted for the arts of refining iron by puddling with mineral coal and of rolling metals in grooved rolls." The church contains a bust of Keats, carved by Anne Whitney, and presented by American admirers of the poet.

Honourable Artillery Headquarters, City Road.—The H.A.C. received its charter of incorporation from Henry VIII. in 1537, and has occupied its present ground since 1642. Four of its members—Duncan, Keayne, Sedgwick, and Spencer—who emigrated in the seventeenth century, founded in 1638 the Ancient and Honourable Company of Boston.

Little Britain, Smithfield.—Benjamin Franklin lived in Little Britain on his first coming to London. It was then a centre of the bookselling and printing trade. He obtained employment at Palmer's printing house in Bartholomew Close, the works, it is believed, then extending into the Lady Chapel of St. Bartholomew's Church, where Franklin is reputed to have set type.

Pilgrim Fathers' Church, New Kent Road.—Erected principally by American subscribers in memory of the Southwark men who sailed in the *Mayflower*.

St. Ethelburga's, Bishopsgate.—In 1607, Henry Hudson, the navigator who gave his name to Hudson Bay, was appointed by the Muscovy Company to command the *Hopeful* in a voyage "to discover the pole," and sail across to "the islands of spicery." On April 19, Hudson, his son John, and his ten sailors took communion in St. Ethelburga's, "purposing to goe to sea foure days after."

St. George's Church, Hanover Square.—Here, on Dec. 2, 1886, Theodore Roosevelt, "twenty-eight, widower, ranchman," was married to Edith Kermit Carow.

St. Giles's, Cripplegate.—Contains the grave of Sir Martin Frobisher, the Elizabethan seaman, who attempted to discover a north-west passage to Cathay, and commanded the *Primrose* as vice-admiral to Drake in his expedition to the West Indies.

St. Helen's Church, Bishopsgate.—Contains a Shakespeare memorial window presented by Mr. William Prentice, an American. Shakespeare is believed to have been a ratepayer in the parish.

St. Margaret's Church, Westminster.—The parish church of the House of Commons, and perhaps the most American spot in all London. The window over the western door was put up in 1882, at the cost of Americans, to the memory of Sir Walter Raleigh, who was executed in Old Palace Yard hard by, and whose headless body, and the body of his son Carew, lie in the chancel. The quatrain below is by James Russell Lowell. (See also *Tower of London*.) The Milton window, at the west end of the north aisle, was the gift of Mr. G. W. Childs, of Philadelphia, and bears an inscription by Whittier. (Milton

married his second wife in St. Margaret's.) Below the window is a tablet to Sir Peter Parker, who sailed the *Menelaus* up the Chesapeake during the war of 1812-14, and was killed while leading a landing party against the Americans. On the south wall is a memorial window to Phillips Brooks, Bishop of Massachusetts; and over the vestry door is a window erected to Lady Arabella Stuart by an American lady. The church also contains the grave of Elizabeth, daughter of Dinwiddie, Governor of Virginia.

St. Olave's Church, Hart Street.—Contains a memorial to John Watts, President of the Council of New York before the declaration of independence; and one (removed from All Hallows Staining) to Monkhouse Davison and Abram Newman, who exported to America the chests of tea which were thrown into Boston Harbour.

St. Paul's Cathedral.—In the south transept of the Cathedral are memorials of three men who were actually associated with the wars between England and America—(a) Charles, first Marquis Cornwallis, who subdued New Jersey, occupied Philadelphia, and invaded Virginia, but was compelled to surrender to Washington at Yorktown; (b) General Sir Isaac Brock, who commanded in Upper Canada, and received his death-wound while repelling an American invasion on the Niagara frontier; and (c) General Robert Ross, who commanded the expeditionary force against the United States in 1814, won the battle of Bladensburg, and captured Washington. On the left of the porch are statues of General Pakenham and General Gibbs, who were killed at the attack on New Orleans on Jan. 8, 1815, after peace had been signed, unknown to them. General Dundas—monument in the north transept—was one of the commissioners who arranged the capitulation at Yorktown. In the "Painters' Corner" of the crypt is buried Benjamin West, born in the United States in 1738, who came to England in 1763, and succeeded Sir Joshua Reynolds as second President of the Royal Academy. For forty-five years he lived and worked in No. 14, Newman Street, Oxford Street, and died there in 1820. His "Stoning of St. Stephen" hangs in St. Stephen's Church, Walbrook. The crypt also contains a bronze tablet on marble in memory of Edwin Austin Abbey, R.A., the American artist.

St. Sepulchre's Church, Holborn.—On the south side of the choir is buried the gallant Captain John Smith, "sometime Governour of Virginia and Admirall of New England," who would have been put to death by the Red Indians but for the intercession of Pocahontas. Princess Pocahontas is buried in St. George's Church, Gravesend.

St. Stephen's Church, Coleman Street.—The Rev. John Davenport, who, with other refugees, landed at Boston in 1637, and founded the colony of New Haven in the following year, was vicar of this church from 1624 to 1633. The colony was composed in part of former residents of this parish. The tablet in the church to Davenport's memory was erected by one of his American descendants.

Southwark Cathedral.—John Harvard, who founded the great college at Cambridge, Massachusetts, was the son of Robert Harvard, who kept the "Old Queen's Head" in High Street, Southwark. He was baptised in St. Saviour's (now the Cathedral) on Nov. 29, 1607. The chapel of St. John the Divine, in the north

transept, once used as a magistrate's court, was restored at the cost of Harvard students, as a memorial of their founder; and in May, 1905, Mr. J. H. Choate, American Ambassador to England, and a graduate of Harvard, unveiled the memorial window which he had presented. The window was by La Farge, of New York. The Cathedral also contains a memorial of William Emerson, "who lived and died an honest man," and from whose stock Ralph Waldo Emerson is supposed to have sprung.

Stoke Newington.—Edgar Allan Poe spent five years of his boyhood at the Manor House School, kept by the Rev. Dr. John Bransby.

Tower of London.—Of all the prisoners of the Tower perhaps none is more famous than Sir Walter Raleigh, who was first committed there in July, 1592, on account of his intrigue with Bessie Throckmorton, one of Queen Elizabeth's maids-of-honour. Here he came again, in James's day, after being condemned to death. The fruit of his many years' imprisonment in the Bloody Tower was his "History of the World"; and here he spent the last days before his execution in Old Palace Yard. William Penn was another famous Tower prisoner. The publication of his "Sandy Foundation Shaken," without licence, led to his committal to the Tower under a warrant dated December 12, 1668. While there he wrote his famous "No Cross, no Crown," and "Innocency with her Open Face." He was released from the Tower in July, 1669. In September of the following year he was, with William Mead, tried at the Old Bailey for addressing a tumultuous assembly, and acquitted, but went to gaol in default of paying a fine for refusing to take off his hat in court. A tablet has been placed in the Old Bailey in memory of the jury, who were locked up for two nights without food and fined for refusing to bring in a verdict of "Guilty" against Penn.

Westminster Abbey.—In the south-west corner of the nave is a memorial to Viscount Howe, killed before Fort Ticonderoga in 1758, during the first expedition of that name. The monument was erected by the people of Massachusetts a few years before the province severed itself from the mother country. In the south aisle of the nave is the memorial to Major John André, Adjutant-General of the British forces in America, who was hanged as a spy by Washington. His body was brought from America and buried near this monument, and the chest in which it was preserved may be seen in the Islop Chapel. The south-west corner of the nave contains a stained-glass window, presented by Mr. G. W. Childs, in memory of the poets George Herbert and William Cowper; and in the choir is a tablet to Colonel J. L. Chester, the American genealogist, who compiled many of the extant registers of the Abbey. In the north cloister lies General John Burgoyne, Commander-in-Chief of the British forces during the early part of the war. Colonel Enoch Markham is also buried there, wrapped in the colours of his old regiment, the 112th Foot, or Royal Musketeers. He fought under Wolfe, and also through the War of Independence. In the Poets' Corner is the grave of Sir Archibald Campbell, who, on the outbreak of the War of Independence, sailed as lieutenant-colonel of the Highland regiment raised by Simon Lovat, and was taken prisoner immediately on reaching Boston. Released after a year of captivity, he took his revenge by seizing Savannah with the loss of only four men.

Alcohol from the Cactus Plant.—After research work at the instance of a group of American capitalists it is announced that a practical scheme for distilling alcohol from cactus has been devised. With the crudest sort of stills the Mexicans have been manufacturing alcoholic liquors from certain forms of cactus for generations. The supply of cactus at low cost is practically inexhaustible. On the other hand, cactus is a quick-growing form of vegetation that under cultivation would renew itself in the course of about eight months, and can be grown on land that would not support anything else. There is a great future in cactus development for alcohol manufacture, alcohol being one of the materials which must be produced for manufacturing munitions and for other industrial purposes.

Anthrax from Wool.—The Departmental Committee appointed to enquire into the danger of infection by anthrax from camel-hair, goat-hair, and wool has reported that the disease can only be stopped by preventing it among animals, or by destroying the organisms in the hair or wool. The Committee estimate that at the central station which they recommend 10,000,000 lbs. of wool could be treated annually at a cost of £10,000, computed at pre-war prices.

Bears Evolved by Isolation.—Dr. Hart Merriam, in a review of the grizzly and big brown bears of North America (contributed to the Bureau of Biological Survey, Washington), offers further evidence of the important part played by isolation in the evolution of species. Twelve years ago he recognised eight species of grizzly and brown bears in this group; this number has now increased to eighty-six. From his collection of skins and skulls he has been able to show that no sharp dividing line exists between the grizzly and the brown bear. Another surprising result is the discovery that Admiralty Island, off South-East Alaska, is inhabited by no fewer than five distinct species of big bears, each of which is related to and representative of a species on the adjacent mainland.

Biscuits Infested by Flour-Moths.—The British Museum have published a Report by Col. W. W. O. Beveridge and Mr. Hartley Durrant on the infestation of Army biscuits by flour-moths. Eight species of beetle and four Pyralid moths were found in the tins of biscuits examined. Evidence was adduced showing that Central America is probably the original home of the *Ephestia kuehniella*, the so-called Mediterranean flour-moth, and by far the most serious pest. The examination of various intact airtight tins showed that the biscuits contained therein were infested, thus indicating that the moths had gained access to them in the factory prior to packing. The temperature in the centre of the biscuit during baking was found to rise to a minimum of just above 100° C., and as it is considered that insect-eggs could not survive this temperature, it is held that the infestation of the biscuits must take place during the cooling and prior to the tins being soldered. It is suggested that screened cooled air be passed over the biscuits as soon as they are baked, so that the moths may not oviposit on them; and further, that the packed tins be punctured, heated to a lethal temperature, and then soldered up.

British Association.—The meeting of the British Association, which it was hoped would be held in Cardiff in 1918, was cancelled. Sir

Arthur Evans consented to be president for another year. The council have been urged to hold a meeting in London in 1919, if it should not be possible to meet at Bournemouth.

Channel Ferry Scheme.—It was publicly announced in August that a ferry across the Channel, conveying trucks direct for use on the railways of England and France, had been developed into a proper train-ferry for both passengers and goods traffic, and the Channel was thus practically bridged. The first journey on the ferry was made on February 22. The subject has engaged the attention of the British Chamber of Commerce in Paris, who propose to utilise Dover for ferry-steamers of deep draught, as the terminal port on the English side; but there is a suggestion of reviving an earlier idea by preferring the development of a new harbour on the French side to the improvement of either Calais or Boulogne, where the existing facilities are inadequate for the reception of the large ferry-ships. It is estimated that provision could be made for an average daily traffic of 4,000 tons in passengers and goods by a capital outlay of £6,000,000.

Cheese Mites.—Miss N. B. Eales, of the Zoology Department, University College, Reading, has made several experiments on the life-history and habits of cheese mites, which are the cause of much damage, especially to Stilton and Wensleydale cheese. She found that the mites persisted in the cheese-room from December to April, when the room is not in use, in spite of drastic cleaning methods, and that they could be carried by flies and moths. Hot water or steaming, or treatment with sulphuretted hydrogen or formalin, was useless as a means of destruction, and in one case of experiment with carbon dioxide the mites awoke after 66 hours of suspended animation. Treatment with carbon bisulphide proved very successful.

Coal Storage under Water.—Mr. G. F. Zimmer, writing in *Engineering* on the storage of coal under water, says that the method, though expensive at first, is the most economical in the long run. When experiments began about fourteen years ago, it was believed that only sea-water would preserve coal from deterioration, but it has since been shown that fresh-water is equally good. Under-water storage prevents loss of heating value, and is not accompanied by deterioration in physical properties, such as slackening. The water retained by the coal on removal is practically only that held by adhesion or capillarity. The first large plant of this kind was installed at Chicago, where 14,000 tons of coal are stored under water; and since then the largest installation has been erected by the Duquesne Light Company at Pittsburgh, consisting of a pit 800 ft. long, 150 ft. wide, and 25 ft. 6 in. deep, with the sides sloping at 45°. The capacity is 100,000 tons of coal. Coal recovered from the battleship *Maine*, after fourteen years' submergence, showed on analysis to have suffered only 1.9 per cent. deterioration.

Constitution of the Sun.—Dr. A. Riccò, of the Astrophysical Observatory of the Catania University, published in *Scientia* a summary of our knowledge of the constitution of the sun. The high temperature and pressure existing there are so much above those obtainable in a laboratory that it is impossible to ascertain what their effects on the properties of matter are likely to be. Little doubt exists that the temperature of the interior exceeds 7000° C., and is well above

the critical temperature of the substances of which the sun is composed. As a consequence, those substances should be in the gaseous state; but under the enormous pressure to which they are subjected their molecules are so close together that the properties of the gases must be similar to those of liquids, or even solids, as known from laboratory experiments.

Electric Ships and Coal Saving.—About the middle of last year the first electrically propelled merchant vessel constructed in a British yard, and the largest electric ship in the world, left a north-eastern port on her maiden voyage. It was designed on the Ljungstrom turbo-electric system already adopted on a number of small foreign merchant vessels, by which steam turbines drive the electric motors that actually operate the propeller. The mechanism is controlled from a switchboard similar to that in an electric power station. The advantages claimed for the turbo-electric system are coal economy and increased cargo space. Tests carried out in the foreign vessels show a low fuel consumption, while it is estimated that the British ship, 6,400 tons, will accommodate from 8 to 10 per cent. more cargo than an ordinary steamer of the same size.

Fish-Tail Inscriptions.—Some curious markings on the tail of the fish known as *Holocanthus semicirculatus*, a widely distributed species in the Indian and Pacific Oceans, were described by Mr. T. Regan at a meeting of the Zoological Society by means of photographs. The markings resembled old Arabic characters for "There is no God but Allah," and "A warning sent from Allah," and when they were recognised at Zanibar, where the fish had been originally sold for a penny, there was tremendous excitement, and the price rose to 5,000 rupees. The fish has been preserved, and photographs have been sent to London.

Fruit Preservation.—Dr. S. A. Kapadra has made an improvement in the Lawton method of preserving perishable foodstuffs. The objection to the earlier method was the use of carbon monoxide, which formed an explosive mixture, for which Dr. Kapadra substituted carbon dioxide and nitrogen, with only a trace of oxygen. Salted fish which was kept in the preserving chamber for six weeks appeared to be in the same condition as when introduced. Eggs preserved for twenty weeks could be afterwards boiled without the shell cracking, as if new-laid. Australian apples kept for five weeks were found to be as good as at first, and the rottenness from some of the specimens had not spread to the neighbouring sound fruit. Raspberries after a fortnight of the same treatment were as fresh as when the experiment started, and they retained this freshness for four days after leaving the preserving chamber, thus allowing time for the fruit to be marketed.

Gibraltar Straits Tunnel.—The French Society of Civil Engineers, having theoretically disposed of the difficulties attending the construction of the Channel Tunnel, have been considering a similar scheme for the Straits of Gibraltar, which shall unite the railway systems of Europe and Africa. The depth of the sea in the Straits of Gibraltar would make it necessary to cut the tunnel at a depth of about 840 metres, starting at Tarifa, west of Gibraltar, on the Spanish side, and ending on the Moroccan Coast, a distance of 16 miles. The cost of construction is estimated at £10,000,000, but another £4,000,000

would be necessary for port improvements. M. Henri Bressler, who puts forward the scheme, looks to the day when it will be possible to travel from London to Cape Town entirely by rail.

Glacier Movement Intermittent.—Professor Mercanton, in the *Revue Générale des Sciences*, discusses the result of recent investigations on Alpine glaciers, systematic work on which was begun nearly forty years ago, although the main advances and retreats of the principal glaciers have been known for three centuries. Recent investigations show that the volume and length of a glacier can to a certain extent vary independently, viz., that the ice can move down a valley from the more expanded glacier snow basin at its head at an intermittent rate, so that a belt near the end may be swelling up into a wide mound, thus increasing the actual volume of ice, while the end itself is in retreat.

Ice Pressure and Compressed Air.—Compressed air has been successfully tried in countering the ice pressure against the dam across the Mississippi river at Keokuk, Iowa. The thrust of the ice against the gates was estimated at 3.7 tons per linear foot, and by using a steam jet a line of clear water 3 in. wide was made at the back of each gate. But the work was slow, and a simpler method had to be devised. The experiment of introducing compressed air behind the gates in order to keep the water in motion was tried, and it was found that with less than a cubic foot of free air per minute an area 20 ft. in diameter could be kept clear. The air, introduced at a depth of 18 ft. below the surface, carried the warmer water from below to the top, keeping up a continuous circulation which prevented the ice from forming.

Insect Pests in Ceylon.—A firm footing in Ceylon has now been acquired by the insect pest known as *Icerya purchasi*. It is found to be especially destructive to citrus trees, but it may be found on the grape, rose, pomegranate, castor, mulberry, apple, peach, apricot, fig, walnut, pepper, and potato. The Government of India has taken measures to prevent the pest entering that country. The United States of America, in view of the damage done to the orange groves, sent an investigator to Australia, the original home of the pest, and he brought back a number of small red and black ladybird beetles, which dealt effectively with the *Icerya* when introduced into California.

Irish Caves.—The third report of the Committee for the Exploration of Irish Caves deals with Castlepook Cave, County Cork, which was excavated by the late Mr. R. J. Ussher. The deposits on the floor consist of decomposed limestone and stalagmite, and sand and local stones brought in by running water. The cave seems to have been too damp to be inhabited by man, but the remains in the lowest layer on the floor show that it was first frequented by a large variety of the brown bear, and afterwards, as shown by the remains on the second layer, became the haunt of spotted hyenas. These animals introduced an enormous number of bones of the reindeer and some young individuals of the mammoth. Remains of the Scandinavian lemming and of a new species related to the Arctic lemming were also discovered. Later deposits showed the bones and teeth of domesticated animals, which appear to have been introduced partly by foxes and partly by accidental falls. Dr. Scharff, who describes the mammalian

remains, points to the importance of the discovery of the cave hyena in Ireland, and the interest of the proof that it was a contemporary of the reindeer.

Lighthouses on the Great Barrier Reef.—Mr. J. F. Rambotham, the Director of Lighthouses to the Australian Commonwealth, gave to the Liverpool Engineering Society an account of the lights erected between the Great Barrier Reef and the east coast of Queensland in recent years. The foundations differ for each light, which is of 1,500 candle power, and visible thirteen miles away. The Aga system of unattended lights was adopted. Acetylene dissolved in acetone at ten atmospheres pressure is used, and the supply lasts one year. A pilot flame is always burning, and the lights are turned on and off by a sun valve, so delicately constructed that it has been known to bring the light into operation during a rainstorm. The cost of each unattended light is £30 per annum, as against £578 if it were worked by man-power.

Manchester Water Supply.—The average daily consumption of water in Manchester has increased so much in recent years that it has been found necessary to investigate new sources of supply. It is proposed to tap a new drainage area in the Lake District, extending over 40 square miles and including Haweswater. The plan is to build a masonry dam across the north end of the lake, which will increase its length from $2\frac{1}{2}$ to $4\frac{1}{2}$ miles, with a corresponding increase in width. The aqueduct from Haweswater to Manchester will be 83 miles long, or 22 miles less than that from Thirlmere to the city. It will begin with a four-mile tunnel to the head of Long Sleddale, thence down the valley to a point near Kendal, and on to Kirkby Lonsdale. After being carried across the River Lune it will pass in a ten-mile tunnel under the Forest of Bowland, across the valley of the Hodder, and on to a point near Accrington, whence it will go through an eleven-mile tunnel to a service reservoir near Bury. The new scheme will supply Manchester with an additional 70-80,000,000 gallons a day, sufficient to meet the needs of the city for the next generation.

Meteorite in Scotland.—At the January meeting of the Royal Society of Edinburgh a discussion took place on the "Strathmore" meteorite which fell on December 3. The meteorite attracted attention from its brilliant appearance before it burst, and from the arrival of three fragments in Perthshire and one in Forfarshire. It was considered that the Strathmore meteorite was an aerolite or stony meteorite, and from the evidence given by a number of witnesses it was concluded that it began to blaze at a height of about twenty miles in the atmosphere, perhaps vertically above Cupar. It was suggested that, more probably than in any other way, meteorites have risen from ejections from lunar volcanoes, which would solidify instantly and continue to circulate between the earth and the moon in irregular orbits, until one after another they were picked up by the earth in its passage.

Neanderthal Man in Malta.—Professor Arthur Keith announced in *Nature* that Dr. Giuseppe Despott, working for a research committee of the British Association, had brought to light the remains of Neanderthal man in the cave of Ghar Da'am, in the south-eastern corner of Malta, "thus extending the distribution of this species to another continent; for, in a zoological

sense, Malta is African rather than European." The remains consisted of two teeth—a first upper molar and a milk molar. The cave is more than 700 ft. long, 26 ft. to 60 ft. wide, and the strata run down to a depth of 12 ft. Every trench 50 ft. has yielded traces of man, and Professor Keith thinks it is not too much to hope that "we have here a Pleistocene Palace of Knossos, a site which is likely to throw the same light on early man in the Mediterranean as was thrown on the Bronze period of that area by the discoveries made by Sir Arthur Evans in Crete."

New Star in Aquila.—A new star of the first magnitude was discovered at 9.30 p.m., Greenwich time, on Saturday, June 8, 1918, by Miss Grace Cook, at Stowmarket. Mr. Stevenson, in South London, observed the new star at 10.30 p.m., and M. Felix de Roy, Secretary of the Astronomical Society of Antwerp, saw it at 10.45 p.m. from Thornton Heath, Croydon. The facts regarding the discovery have been fully verified at the Royal Observatory. The new star was situated in the constellation Aquila, on the northern edge of the southern branch of the Milky Way. It was estimated that if the star, which showed a stellar image with the largest telescope, were as near to us as the sun is, it would be thousands of times brighter as viewed from the earth. No new star of such brightness, easily visible to the naked eye, had been observed since 1901, when Anderson discovered Nova Persel.

Ozone—is it a Myth?—Professor Fowler, at the British Astronomical Association, described a series of experiments which he and Professor Strutt had made on the spectrum of the sun. Certain bands in a photograph of the spectrum of Sirius, a very hot body, suggested the presence of ozone. The investigators thought that if the bands showed in the spectrum of Sirius they should also show in that of the sun, and be due not to the hot atmosphere of the luminary, but to our own upper atmosphere. This conjecture proved to be true, a further test for the presence of ozone in the lower regions of the atmosphere only revealing the faintest trace in a column of air four miles long. Professor Strutt's conclusion that there is practically no ozone in the lower atmosphere will come as a surprise to some of our seaside resorts.

Painting Iron.—Dr. J. N. Friend has conducted an investigation with the object of discovering the principles underlying the successful application of paint to iron. He exposed a number of steel plates, coated with various paints, to the weather, for a period ranging from five to thirty months, and then calculated the loss from corrosion. He found that the addition of pigment to oil increased the oil's efficiency as a protective up to a certain point, but beyond that point the further addition of pigment caused deterioration. The primary cause of crinkling was that linseed oil on setting expands a little over 3 per cent. The pigment toughens the film, makes it less permeable to water, vapour, and oxygen, and reduces the expansion of the oil on setting, and thus minimises the tendency to crinkle. The most permanent paints are those containing black or red pigments, which absorb the shorter rays of light and prevent them from quickening the destructive oxidation by the air. Finer pigments afford greater protection than coarse ones, since they are more thoroughly in contact with the oil. A

thick coat of paint protects the metal under it more effectively than a thin coat, and two thin coats are better than one thick one of equal weight.

Papers from Sawdust and Grass.—Successful experiments in making paper from sawdust were carried out at the Donside Paper Mills, Aberdeen, and last May an edition of the *Aberdeen Evening Express* was partly printed on paper containing a large percentage of sawdust. The sawdust requires careful handling, and in ordinary circumstances it would not have been worth the trouble to utilise it, but with mechanical pulp at ten times its pre-war price the sawdust substitute became advisable. In the making of the newspaper, sawdust from all soft woods, such as pine, spruce, and aspen, can be employed. At a meeting of the executive council of the Imperial Institute it was stated that grasses from South Africa, Australia, the Federated Malay States, and St. Helena had been examined with a view to their utility as paper-making materials. Samples of "tamboukie" and similar grasses from the Pretoria district gave a high yield of pulp of good quality, capable of conversion either into excellent brown paper or (after bleaching) into white paper. Lalang grass—which grows abundantly in the Malay States, and hitherto has been so little esteemed that on the rubber plantations it is regarded as a troublesome weed—compared favourably as a paper-making material with Algerian esparto grass, though not quite so good as Spanish esparto. Bamboo grass from the Northern Territory of Australia came up to the same standard. All these grasses, it was stated, would be suitable for utilisation in their countries of origin for the manufacture of either pulp or paper. Arrangements have been made for establishing the marine grass *Spartina townsendii* on the mudbanks of the Medway between Chatham and Sheerness, in order to increase the home supply of paper-making materials.

Peat Fuel.—Mr. S. C. Davidson, of Belfast, has invented a method of treating peat for fuel purposes. It consists of breaking up the peat, and mixing it with 15 per cent. of pitch, after which it is put under hydraulic pressure of two tons to the square inch. From this process the peat emerges looking like polished hard wood, which burns steadily with a yellow flame.

Pitdown Skull.—In the *American Journal of Physical Anthropology*, Mr. G. S. Miller gave an elaborate study of the jaw discovered at Pitdown in 1912. It is believed by some anthropologists that it belonged to the human cranium close to which it was found, while the view of others is that it is the jaw of a chimpanzee, accidentally washed into proximity with the skull. Mr. Miller accepts the chimpanzee view. While the brain-case is human in structure, he says, the jaw and teeth resemble human jaws and teeth only in those points which are common to men and apes. The generic features of the jaw and teeth have not been shown to differ from those of living African chimpanzees.

Pit Timber Preservation.—Professor Percy Groom, in investigating the cause of the decay of pit timber, pointed out that the destruction is due to the fungi which cover the surface of the wood with fluffy spawn, which spreads and emits spores that are carried to other timber. He suggested that every fructification should be cut out of the wood and carried to the surface of the pit and burned in the boiler fires, and that

an antiseptic solution, such as creosote, zinc chloride, or copper sulphate, should be applied to the spawn and the accessible wood. The timber should also be made immune from attack by fungi by soaking it in an antiseptic solution. It may be added that the United States Forest Service has treated a number of timbers by various processes, and then placed them in the coal mines at Pottsville, Pennsylvania, with convincing results of the efficacy of zinc chloride and creosote as preservatives.

Rail Creep.—At the Institution of Civil Engineers two papers were read on "rail-creep," or the tendency of rails to creep along in a longitudinal direction with the traffic, so that their position has to be constantly rectified. Mr. F. Reeves described his own experiments on laths of pine, iron, and rubber, by causing loaded wheels to pass over them, and said he had come to the conclusion that the creep was due first of all to deformation of the rail as the wheel passed over it. If the load were heavier, or the rigidity of the rail reduced by using shorter sections or weaker materials, the creep increased. The weight of the wheel was the most powerful factor affecting the amount of creep, and it was also accentuated by braking, and was greater down-hill than up-hill. It was suggested that double anchorage or resistance would help to get rid of the difficulty.

Rivetless Steel Ship.—At one of the many shipbuilding yards which have sprung up during the war the first steel vessel built without rivets was launched. The plates, instead of being riveted and caulked, are joined together in one process by electric welding. Were the process generally adopted it is believed that production would be considerably speeded up, more particularly in the assembling of bulkheads, deck structures, and internal fittings. Indeed, the authorities are said to estimate the possibility of a saving of 20 or even 25 per cent. in both time and material. Three sorts of welding were adopted in the new steel vessel. Its shell, up to and including the bottom seam of the bilge plate, was continuously welded inside and out, and so were the iron seams. The outside was continuously welded, but the inside was "tack" welded. In tack welding you weld a short section, say, three inches, and then miss another section of about twice the length. Frames, floors, deck-brackets, and non-water-tight bulkheads were all tack-welded; the watertight bulkheads were continuously welded.* On the other hand, the deck plates were "butt" welded, the plates being arranged end to end without any overlap.

Saccharine as a Sugar Substitute.—At the instance of the Ministry of Food, the Food (War) Committee appointed by the Royal Society conducted an investigation into the use of saccharine as a sugar substitute. In their report the Committee stated that saccharine, regarded as a drug, is a very inert substance. An irritant action on the gastric intestinal tract or on the kidneys during elimination had been attributed to it, and it had also been credited with an inhibitory effect on the action of the digestive ferment. "It can be safely stated," says the Committee, "that for the healthy adult saccharine has no harmful action in practicable doses. Experimental evidence is, however, unfortunately lacking as to whether it is equally harmless in the case of children and of those suffering from chronic

digestive complaints. The Committee feel that the issue of saccharine can be recommended only if it will alter the incidence of the sugar loss so as to make more sugar available for domestic purposes." They had specially in mind the welfare of the children. "The only useful diversion of sugar which could be produced by a substitution of saccharine is from tea, coffee, confectionery, and mineral waters."

Shells Photographed in Flight.—In the *Central Zeitung für Optik und Mechanik* is described a means of photographing shells in flight by means of a cinematograph camera. A specially broad film moves forward in jerks, and at each rest a photograph is taken through the thin slits of a rotating screen. The width of the slits determines the length of the exposure. As the time between one stationary position and the next is too great in comparison with the rate of motion of the shell, many slits are cut in the screen, and several exposures are made on the same section of the film so as to show the shell at various stages of its journey.

Steamer Smoke Invisible.—An article in the *Engineer* describes a system developed by Messrs. Yarrow for preventing the smoke from a steamer betraying her presence to the enemy. A tramp steamer, it is said, with the usual type of funnel emits a column of smoke to a height of 150 feet, which can be seen by an observer 17 miles away, whose eye is 15 feet above sea-level. The invention consists of two smoke-ducks leading from the funnel to each side of the steamer. The mouths of the ducts are inclined downwards towards the surface of the sea. The funnel is closed by a damper when the ducts are opened. Each duct has a water-spray inside which delivers a conical spray arranged just to touch the exit edges of the ducts. The spray cools the hot gases, causing them to fall to sea-level, and absorbs a large proportion of the solid particles of carbon in the smoke, thus reducing its blackness, and therefore its visibility. The smoke never rises above the level of the bridge, and its appearance is like that emitted by a locomotive, which is black only for a minute or two after the furnace fires have been stoked afresh.

Sugar from Grass.—M. Daniel Berthelot explained to the Academy of Sciences in Paris a number of experiments which have been made with the object of extracting sugar from sorghum—a species of grass—in order to make good the deficiency of sugar in France. Sorghum was first cultivated in 1917, and certain districts of France were sown, but the crop does not ripen till October. According to M. Berthelot, it contains, like the beetroot, about 14 per cent. of sweetening properties, but up to the present it has not been possible to crystallise sorghum sugar. It can, however, be used as a liquid sugar, as in Japan, where the ordinary process consists in simply crushing the stalks and extracting the juice by use of a press.

Water-Power from the Scottish Highlands.—Mr. Alexander Newlands, engineer-in-chief of the Highland Railway, in a paper on the water-power of the United Kingdom, read before the Royal Society of Arts, condemned the past neglect of this subject in industrial circles. One cubic foot of water per second falling through 11 feet could, he said, supply a horse-power unit to any modern turbine; yet out of a total of 10,500,000 horse-power generated in industrial engines in the United Kingdom in 1907 only

1.6 per cent. was obtained from water. Owing to the absence of large lakes and the lack of sufficient elevation in England, Ireland, and Wales, no great development of water-power was to be expected; but in Scotland the case was different. Some of the large rivers in the Highlands have a fall of 14-16 feet per mile. He calculates that in Scotland, chiefly in the Scottish Highlands, there are 11,500 square miles of country with a rainfall of over 50 inches, as compared with 3,360 square miles in England, 3,390 in Wales, and 5,910 in Ireland. By impounding the discharge, and assuming that two-thirds of an average rainfall of 42 inches would be available for power purposes, he estimates that the supply would amount to 375,000 horse-power. Mr. Archibald Page has computed that in 1916 the power requirements of Scotland were 1,190,000 horse-power units, towards the provision of which the 375,000 laid out in Mr. Newlands' scheme would go a considerable way.

Water-Power in India.—Mr. Alfred Dickinson, in a paper on water-power in India read before the Royal Society of Arts, suggested that the Indian Government should immediately undertake an investigation of the possible sources of water-power in the Peninsula. Research conducted at the expense of Messrs. Tata had shown that by building a dam across a valley in the Western Ghats water from the Kayna River could be harnessed to provide approximately 300,000 horse-power for every hour in the year. Such a supply, he said, at 0.3d. per horse-power hour, would give India the greatest industrial filip she is ever likely to receive from a single discovery.

Wireless Fog Signalling.—An important application of wireless telegraphy to the working of unattended lightships and lighthouses, and unattended fog-signals, is described in the *Engineer*. It was in 1913 that an automatic acetylene fog gun was introduced at Dhuheartach lighthouse, which fired as often as once every fifteen seconds as against once in five minutes by the tonite apparatus. Two acetylene fog guns have since been installed at Fort Matilda Pier and Roseneath Beacon, on the Clyde. When fog appears a wireless aerial on Gourock Pier transmits energy to aials on the Beacon and at the Fort, thereby completing the circuits of the local batteries and switching on the fog signals. The guns, which are supplied with acetylene mixed with air, work automatically, and the report can be heard three miles away in favourable weather.

X-Rays and Brain Surgery.—The archives of Radiology and Electrotherapy contain an account of the extraction of a small metallic fragment from the brain, in a case in which Captain Rayner was the surgeon and Captain Barclay the radiographer. By means of the X-rays the metal was located, at about two inches below the surface, and the skull was then opened. The points of the forceps were then introduced into the brain, and manipulated so that the shadows of the fragment and of the points of the extractor fell exactly in the middle of a small fluorescent screen attached to the instrument. After a little time the fragment was seized and withdrawn. The extractor was connected with an electric bell, which rang when the fragment was grasped. The patient made a good recovery.

THE theatrical season of 1918 was one of ups and downs, but, on the whole, managers had little cause for complaint. At one time the demand for theatres was greater than the supply, while later there was something in the nature of a slump; but the year closed with great business, as victory after victory put a stop to hostilities. Several productions outran the estimates of their backers, and had to be transferred to other houses, as their original homes were required by other managers. The outstanding successes were those of the previous year, *Chu Chin Chow*, at His Majesty's, reaching its thousandth performance, while *The Maid of the Mountains*, at Daly's, and *The Better 'Ole*, at the Oxford, ran a close race for second place, the former running throughout the twelve months, and the latter until the end of fighting destroyed its appeal. *The Boy*, a musical version of Sir Arthur Pinero's *The Magistrate*, was another 1917 production that did not need a successor, passing its 500th performance.

With regard to the new productions, comparatively few of our leading authors were represented in the list of new plays. Sir Arthur Pinero gave London *The Freaks*, but it was not up to his usual high standard. On the other hand, *The Tittle*, a satire by Mr. Arnold Bennett, achieved big popularity. Most of the successful plays were either of the lighter variety or war melodramas, one of the best of the latter being *By Pigeon Post*, at the Garrick. A romantic drama that drew crowded houses was *The Purple Musk*, which Mr. Matheson Lang wrote, produced and played in; while *The Naughty Wife*, a comedy with which Miss Gladys Cooper went into management, and *Nothing But the Truth*, an amusing farce, ran for months. Revues and musical comedies maintained their position, and *The Lilac Domino*, a light opera of better type, filled the Empire for most of the year. Operatic seasons achieved a larger success than had been the case for some time, and proved that London has at last been awakened to the beauties of good-class music.

Shakespeare was not entirely neglected, but the natural demand of the metropolis for relief from the suspense of war offered little invitation to managers to risk expensive productions of the great poet-dramatist. Mr. J. B. Fagan opened a season at the Court late in the year with an admirable revival of *Twelfth Night*, while the Royal Victoria Hall relied largely upon its Shakespearian repertoire, and celebrated its centenary by a special performance—attended by the Queen and Princess Mary—which included extracts from some of the more famous works as well as a kind of revue recalling many of the incidents in the history of the "Old Vic."

The following is a list of the principal London productions of the year:—

ALHAMBRA.—Dec. 24, 1917. *Bluebell in Fairyland*, musical dream play by Seymour Hicks and Walter Slaughter, revived (Messrs. Johnny Danvers, J. C. Buckstone and Dan Agar, and Miss Elaline Terriss). Feb. 16, 1918. *The Bing Boys on Broadway*, a revue by Fred Thompson and Harvey M. Vernon, with music by Nat D. Ayer and lyrics by Clifford Grey (Messrs. George Robey and Peter Wiser, and Mesdames Violet Loraine and Lorna and Toots Pounds).

AMBASSADORS.—Dec. 22, 1917. *The Wonder Tales*, children's plays adapted by Rose O'Neill and Ethel Welch from Nathaniel Hawthorne. Jan. 5, 1918. *Out of Hell*, a war drama by Herbert

Thomas (Mr. H. Brough Robertson and Miss Frances Ivor). Feb. 6. *The Little Brother*, a play by Benedict James (Messrs. Lyn Harding, Fisher White and Ben Nathan, and Miss Mary Grey). April 9. *Too Much Money*, a farce by Israel Zangwill (Messrs. Marsh Allen, Ernest Hendrie and M. R. Morand, and Mesdames Lettice Fairfax, Mary Brough, Lillah McCarthy and Hilda Bruce Potter). June 8. *Romanticism*, Gerolamo Rovetta's drama revived in English (Messrs. Norman V. Norman and Cowley Wright, and Miss Beatrice Wilson). Aug. 31. *Telling the Tale*, a musical farce adapted from *Une Nuit des Noces* by Sydney Blow and Douglas Hoare, with music by Philip Braham (Messrs. Gerald Kirby and Denier Warren, and Mesdames Marie Blanche, Nancy Gibbs and Edmée Dormeuil).

APOLLO.—April 17. *Be Careful, Baby!* a farce by Salisbury Field and Margaret Mayo (Mr. Edward Combermere and Mesdames Helen Raymond, Margaret Bannerman and Peggy Doran). June 26. *Soldier Boy*, by Rida Johnson Young and Edgar Wallace, with music by S. Rombeau and Frederick Chapple (Messrs. Lawrence Leonard, Fred Duprez, Dewey Gibson and Billy Leonard, and Mesdames Winifred Barnes, Sinna St. Clair and Maisie Gay).

COMEDY.—April 10. *The Knife*, a drama by Eugene Walter (Messrs. Aubrey Smith, Farren Soutar and Norman Page, and Mesdames Kyrle Bellew and Helen Haye). June 1. *Tails Up*, a "musical entertainment" by Hastings Turner, with music by Philip Braham (Messrs. Arthur Playfair and Jack Buchanan, and Mesdames Phyllis Monkman, Marie Hemingway, Teddie Gerard and Phyllis Titmuss).

COURT.—Dec. 22, 1917. *The Prodigy*, a farcical comedy by Estelle Burney (Messrs. Charles Windermore and Douglas Munro, and Miss Barbara Gott). Feb. 18, 1918. *Realities*, described as "a new Ibsen play." April 1. *Tactics*, a one-act farce by Thomas King Moylan, and *Fox and Geese*, a comedy by Susanne R. Day and G. D. Cummins, produced by the Irish Players (Mr. Arthur Sinclair and Miss Kathleen Drage). April 12. *Salome*, Oscar Wilde's tragedy, produced privately by the Independent Theatre. Aug. 31. *Damaged Goods*, by Brieux, revived (Messrs. Fisher White and Alfred Brydone, and Mesdames Mary Grey and Joan Vivian-Rees). Oct. 30. *Twelfth Night*, revived by Mr. J. B. Fagan (Messrs. Alfred Brydone, Arthur Whitby, Terence O'Brien, Miles Malleon and Herbert Waring, and Mesdames Leah Bateman, Mary Grey and Mignon O'Doherty).

CRITERION.—Dec. 16, 1917. A triple bill consisting of *The Inca of Jerusalem*, by an unnamed author (Messrs. Raudle Ayrton and Nigel Playfair, and Miss Gertrude Kingston); *Insurrection*, by W. F. Casey; and *Kanawa*, a Japanese play by Torahiko Khorri, produced by the Pioneer Players. June 20, 1918. *You Never Know, Y'Know*, a farce adapted from the French of Georges Feydeau by Martin Henry and Hannaford Bennett (Messrs. Rex London and Fred Eastman, and Mesdames Enid Sass, Daisy Markham and Kitty Barlow).

DRURY LANE.—Dec. 26, 1917. *Aladdin*, by F. Anstey, Frank Dix and Arthur Collins, with music by J. M. Glover and Melville Gideon (Messrs. Robert Hale, Will Evans, Stanley Lupino, Caleb Porter and Harry Cliff, and Mesdames Madge Titheradge and Daisy Bindley). Aug. 28, 1918. *Shanghai*, a "spectacular operette" by William Carey and Duncan Lauri

Wylie, with music by Isidor Witmark (Messrs. Bert Cooté, Harry Claif, Harry Dearth, Alfred Lester and Fred Wright, and Mesdames Joan Hay, Dorothy Brunton and Blanche Tomlin).

DUKE OF YORKS.—*May 2. Hotch Potch*, a revue by Albert de Courville and Wal Pink, with music by Frederick Chapelle (Messrs. Fred Kitchen and Alec Fraser, and Mesdames Nora Delaney, Irene Shamrock and Phyllis Bedells).

EMPIRE.—*Feb. 21. The Lilac Domino*, an operetta by Harry B. Smith, with music by Charles Cuvillier (Messrs. Jamieson Dodds and Frank Lalor, and Miss Clara Butterworth).

GAIRTY.—*Dec. 22, 1917. The Beauty Spot*, a musical comedy adapted by Arthur Anderson from the French of P. L. Flers, with music by James W. Tate, and lyrics by Clifford Harris and Valentine (Messrs. Tom Walls, Douglas McLaren, Jan Oyra and Arthur Whitby, and Mesdames Moya Mantering, Peggy Kurton, Jean Cadell and Regine Flory). *May 22, 1918. Going Up*, a musical comedy by James Montgomery and Otto Harbak, with music by Louis Achille Hirsch (Messrs. Joseph Coyne, Roy Byford, Arthur Chesney and Austin Melford, and Mesdames Marjorie Gordon, Ruby Miller, Evelyn Large and Elaine Inescourt).

GARRICK.—*March 30. By Pigeon Post*, a war play by Austin Page (Messrs. Arthur Wontner, A. E. George and C. V. France, and Mesdames Madge Titheradge and Dorothy Lane).

GLOBE.—*Jan 26. Love in a Cottage*, a comedy by W. Somerset Maugham (Messrs. Sydney Valentine, W. Gayer MacKay and E. Vivian Reynolds, and Mesdames Marie Lohr, Vane Featherston, Ellen O'Malley and Haidée Wright). *May 23. Press the Button!* a farce by Robert Hichens (Messrs. Allan Aynesworth, Stanley Cooke, Arthur Helmore, E. M. Robson and Kinsey Perle, and Mesdames Marie Lohr, Lottie Venne, Vane Featherston and Polly Emery). *June 21. Nurse Benson*, a comedy by R. C. Carton and Justin Huntly McCarthy (Messrs. Fred Kerr, Dawson Milward and Vivian Reynolds, and Mesdames Lottie Venne and Marie Lohr). *Nov. 19. L'Aiglon*, Mr. Louis Parker's version of Rostand's play, produced in aid of the King's Fund for Disabled Officers and Men (Mr. Lyn Harding and Miss Marie Lohr).

HAYMARKET.—*May 1. Uncle Anyhow*, a comedy by Alfred Suto (Messrs. Dennis Eadie, Dawson Milward and Randle Ayrtton, and Miss Athene Seyler). *June 19. Marmaduke*, a comedy by Ernest Denny (Messrs. Dennis Eadie, Sydney Valentine and Vincent Sternroyd, and Mesdames Mary O'Farrell, Mary Jerrold and Helen Rous). *Aug. 1. The Freedom of the Seas*, a comedy by Walter Hackett (Messrs. Dennis Eadie, Sydney Valentine, James Carew and Randle Ayrtton, and Mesdames Billie Carleton and Marion Lorne).

HIPPODROME.—*March 7. Box o' Tricks*, a revue by Douglas Forbes, Leslie Haslam and Harry Grattan, with music by Dave Stamper and Frederick Chapelle. (Messrs. Harry Tate, Tom MacNaughton and Fred Alandale, and Mesdames Shirley Kellogg, Daphne Pollard and Cicely Debenham).

HIS MAJESTY'S.—*Dec. 14, 1917. The Man from Blankley's*, Mr. F. Anstey's comedy, revived in aid of King George's Pension Fund for Actors and Actresses (Messrs. Weedon Grossmith, Charles Hawtrey, and H. B. Irving, and Mesdames Ellis Jeffreys, Irene Vanbrugh, Lottie Venne and Sydney Fairbrother).

KINGSWAY.—*June 24. Cupid in a Caravan*, a farce by Ernest Goodwin (Messrs. Bromley Challenor and H. Tripp Edgar, and Mesdames Marjorie Bellairs, Lucy Sibley and Minnie Leslie). *Sept. 12. A Week End*, a farce by Walter W. Ellis (Messrs. Ernest Thesiger and Dennis Neilson-Terry, and Mesdames Kate Cutler and Clare Greet).

LYCEUM.—*Oct. 2. The Female Hun*, a war melodrama by Walter Melville (Messrs. Sam Livesey and Leslie Carter, and Mesdames Gladys Mason and Annie Saker).

LYRIC.—*May 13. Violette*, a comic opera by Norman Slee, with music by John Ansell (Messrs. Herbert Cave, George Barrett, Leslie Stiles and William Cromwell, and Mesdames Violet Essex and Amy Augarde). *July 10. The Purple Mask*, a romantic play adapted by Charles Latour (Matheson Lang) from *Le Chevalier au Masque*, by Paul Armont and Jean Manoussi (Messrs. Matheson Lang, Henry Vibart and C. H. Croker-King, and Mesdames Amy Brandon-Thomas and Alice Moffat). *Sept. 18. Rozana*, a comedy by Avery Hopwood (Messrs. Basil Sydney and Eric Harrison, and Mesdames Doris Keane and Athene Seyler).

NEW.—*Dec. 24, 1917. Peter Pan*, Sir James Barrie's fantasy, revived (Messrs. Holman Clark and George Shelton, and Mesdames Fay Compton and Isobel Elsom). *Feb. 14, 1918. Freaks*, an "idyll of suburbia," by Sir Arthur Pinero (Messrs. Ben Webster, Fred Kerr, C. V. France and Nigel Playfair, and Mesdames Isobel Elsom, Helen Ferrers, Irene Rooke and Laura Cowie). *April 8. Monica's Blue Boy*, a musical playlet without words by Sir Arthur Pinero and Sir Frederic Cowen (Messrs. Eric Lewis and Martin Lewis, and Miss Mary Glynnie), and *Belinda*, an "April folly," by A. A. Milne (Messrs. Ben Webster, Dion Boucicault and Dennis Neilson-Terry, and Mesdames Irene Vanbrugh and Isobel Elsom). *June 12. The Loving Heart*, a tale from Boccaccio by Henrietta Leslie and John Dymock, with music by Arthur Somervell (Messrs. Basil Gill, Alfred Brydone and Russell Thorndike, and Mesdames Rosina Filippi and Muriel Pratt). *July 11. The Chinese Puzzle*, a play by Marian Bower and Leon M. Lion (Messrs. Leon M. Lion and Eille Norwood, and Mesdames Ethel Irving, Lillian Braithwaite and Ellen O'Malley).

PALACE.—*Dec. 10, 1917. Pamela*, a comedy with music, by Arthur Wimperis and Frederic Norton (Messrs. G. P. Huntley and Owen Nares, and Miss Lily Elsie). *May 18, 1918. Very Good Eddie!* by Philip Bartholomae and Guy Bolton, with music by Jerome D. Kern (Messrs. Nelson Keys, Ralph Lynn, Walter Williams and Stanley Turnbull, and Mesdames Nellie Brierciffe, Helen Temple and Madge Saunders). *Sept. 25. Hullo America!* a revue by J. Hastings Turner, with music by Herman Finck and others (Messrs. Owen Nares, Stanley Lupino and Will West, and Mesdames Elsie Janis, Madeline Seymour and Marjorie Essex).

PLAYHOUSE.—*April 11. The Naughty Wife*, a comedy by Fred Jackson, elaborated and revised by Edgar Selwyn (Messrs. Charles Hawtrey, H. R. Hignett and Stanley Logan, and Mesdames Gladys Cooper and Ellis Jeffreys).

PRINCE'S.—*Dec. 17, 1917. Carminetta*, the operette, transferred (Messrs. Dennis Neilson-Terry and Leon Morton, and Mesdames Alice Delysia and Marie Blanche). *Feb. 17, 1918. The Girl and the Puppet*, by Pierre Louys and Pierre Frondare, translated by Dr. Chalmers Mitchell.

Produced by the Pioneer Players (Messrs. Herbert Norris and Allan Jeayes and Miss Joan Vivian-Rees).

PRINCE OF WALES'S.—Dec. 29, 1917. *Yes, Uncle!* a musical comedy by Austen Hurgon and George Arthurs, founded on José G. Levy's version of "Le Truc de Brésilien," with music by Nat D. Ayer and lyrics by Clifford Grey (Messrs. Leslie Henson, Henri Leoni, Robert Nainby and Davy Burnaby, and Mesdames Margaret Bannerman and Julia James). Mar. 12, 1918. *Flora*, a comedy with music, by Harry Grattan and Herman Darewski and Melville Gideon (Messrs. Walter Williams, Lennox Pawle, and Jo Nightingale, and Mesdames Gertie Millar, Blanche Tomlin, and Veronica Brady). May 14. *Fair and Warner*, a farce by Avery Hopwood (Messrs. David Miller and Ronald Squire, and Mesdames Margaret Halstan and Fay Compton).

QUEEN'S.—Dec. 20, 1917. *A Kiss for Cinderella*, Sir James Barrie's fantastic comedy, revived (Mr. Percy Hutchison and Miss Hilda Trevelyan). April 20, 1918. *Lot 79*, a "farical adventure" by Rida Johnson Young (Messrs. Alfred Bishop, Frank Denton and Percy Hutchison, and Miss Hilda Trevelyan). Aug. 5. *The Luck of the Navy*, a play by Clifford Mills (Messrs. Percy Hutchison, Alfred Bishop and Edward O'Neill, and Mesdames Mary Glynnne and Ruth Mackay).

ROYALTY.—Mar. 20. *The Prime Minister*, a play by Hall Caine (Messrs. C. M. Hallard, Henry Vibart and A. B. Imeson, and Mesdames Ethel Irving and A. B. Tapping). May 30. *The Man from Toronto*, a comedy by Douglas Murray (Messrs. Eric Lewis, Henry Daniell and George Tully, and Miss Iris Hoey). July 20. *The Title*, a comedy by Arnold Bennett (Messrs. Aubrey Smith, Nigel Playfair and Leslie Howard, and Mesdames Eva Moore and Joyce Carey).

ST. JAMES'S.—Dec. 15, 1917. *Charley's Aunt*, Brandon Thomas's farical comedy, revived (Messrs. Kenneth Kent and Marsh Allen, and Mesdames Amy Brandon Thomas and Ada Ferrar). Jan. 24, 1918. *Valentine*, a romantic comedy opera by Arthur Davenport and Charles Wibrow, with music by Napoleon Lambelet and lyrics by Arthur Davenport (Messrs. C. Hayden Coffin and Walter Passmore, and Miss Marjorie Gordon). April 24. *Peg o' My Heart*, comedy by J. Hartley Manners, revived (Miss Moya Mannering). Sept. 2. *Eyes of Youth*, a comedy by Max Marcin and Charles Guernon (Messrs. Ian Robertson and Ernest Dagnall, and Miss Gertrude Elliott).

ST. MARTIN'S.—Dec. 31, 1917. *Sleeping Partners*, a comedy adapted from the French of Sacha Guitry (Messrs. Seymour Hicks, Stanley Turnbull and William Home, and Miss Madge Lessing). Aug. 30, 1918. *The Live Wire*, a spy play by Sydney Blow and Douglas Hoare (Messrs. Donald Calthrop, C. M. Hallard and Alex. Scott-Gatty, and Mesdames Hilda Trevelyan and Helen Morris). Nov. 7. *The Officers' Mess*, a farce by Sydney Blow and Douglas Hoare, with music by Philip Braham (Messrs. Ralph Lynn, M. R.

Morand and Ernest Hendrie, and Mesdames Peggy Kurton, Odette Myrtil and Sybil Carlisle).

SAVOY.—Dec. 21, 1917. *Alice in Wonderland*, revived for matinees (Messrs. Hayden Coffin, Franklin Vernon and Harry Hearne, and Miss Estelle Dudley). Dec. 22. *The Private Secretary*, Charles Hawtrey's farical comedy, revived for evenings (Messrs. Roy Byford and Charles Walenn). Feb. 5, 1918. *Nothing But the Truth*, a farce adapted by James Montgomery from a novel by Frederick Isham (Messrs. A. E. Matthews, O. B. Clarence, Paul Arthur and Charles Glenney, and Mesdames Renée Kelly and Dorothy Minto).

STRAND.—Dec. 24, 1917. *The Happy Family*, by Cecil Aldin and Adrian Ross, revived (Mr. Charles Groves and Mesdames Dorothy Minto and Elaine Inescourt). Feb. 4, 1918. *Cheating Cheaters*, an American "crook" play by Max Marcin (Messrs. Sam Livesey, J. H. Barnes and Michael Sherbrooke, and Mesdames Shirley Kellogg, Helen Haye and Kyrle Bellew). April 9. *Betty at Bay*, a comedy by Jessie Porter (Messrs. Arthur Whitby, J. H. Barnes and Eric Cowley, and Mesdames Christine Silver and Fortescue). July 4. *The Hidden Hand*, a spy play by Laurence Cowen (Messrs. Kenneth Kent, William Stack and Michael Sherbrooke, and Mesdames Saba Raleigh and Peggy Primrose).

VAUDEVILLE.—May 15. *Tabu*, a revue by Harry Grattan and Ronald Jeans, with music by Ivor Novello (Messrs. Alfred Austin, Guy le Feuvre and Hal Bert, and Mesdames Beatrice Lillie, Margaret Campbell and Ethel Baird).

WYNDHAM'S.—June 28. Two short plays and a ballet for children by Sir James Barrie—*La Politesse* (Messrs. Gerald du Maurier and Will West, M. Jules Delacre and Miss Helen Morris), *A Well-Remembered Voice* (Sir J. Forbes-Robertson and Messrs. Gerald du Maurier, H. V. Esmond and Dawson Milward, and Mesdames Lillian Braithwaite and Faith Celli), and *The Origin of Harlequin*. Aug. 29. *The Law Divine*, a comedy by H. V. Esmond (Messrs. Esmond, John Williams and Pat Somerset, and Mesdames Jessie Winter, Doris Lytton, Barbara Hoffe and Marie Illington).

THE STAGE SOCIETY produced the following plays:—Dec. 17, 1917, at the Court, a triple bill consisting of *The Philosopher of Butterbeggins*, a comedy by the late Harold Chapin; *Madame Donnet's Fêtes Galantes*, a ballet; and *Vote by Ballot*, a satiric play by Granville Barker (Mr. Nigel Playfair and Miss Mary Jerrold). Feb. 25, 1918, at the Court, *The Dead City*, a translation by Arthur Symons of *La Città Morte*, by Gabriele D'Annunzio (Messrs. William Stack and Robert Farquharson, and Mesdames Maire O'Neill and Barbara Everest). May 12, at the Court. *The Way of the World*, Congreve's comedy (Messrs. Gilbert Cannan, Russell Thorndike, H. J. H. Brewer and Miles Mallowes, and Mesdames Edyth Goodall, Maire O'Neill, Sybil Thorndike and Hilda Bruce Potter).

Reconstruction.

LET it be perfectly understood that the Ministry of Reconstruction over which the Rt. Hon. Dr. Addison, M.P., presides is simply a misnomer. The Ministry was established by Parliament in August, 1917, "to consider and advise upon the problems which may arise out of the present war, and may have to be dealt with on its determination." The Ministry cannot construct or order anything to be done. It can investigate, report and suggest—then other Departments decide whether they can do anything.

The Ministry of Reconstruction grew from a Committee of Mr. Asquith's Cabinet. It was believed in the early days of the war that on the declaration of peace men and women would slip back into the old grooves from which they were shaken after 4 Aug. 1914, and the only difficulty would be in making the transition as simple as possible and with little concomitant unemployment. Months became years, and the people who had settled down to war conditions, it was discovered, could not be switched off at a moment's notice to peaceful duties. Besides, the numbers that were involved ran into millions, and what civilian tasks could be put on one side had been left to take care of themselves.

The end of the war, whenever it comes, will call for redistribution of labour, revaluation of everything in the light of relative usefulness to the State, with a rebuilding and reconstruction—perhaps an initial destruction—almost everywhere. First of all in importance is demobilisation. Having settled the strength of the fighting forces of peace times, the surplus men and women will need to be found employment; likewise the men and women who have taken up purely civilian war tasks, and for the products of which the demand will practically cease on the declaration of peace. It is said that plans have been made for the demobilisation of the fighting forces on a basis that will regulate the supply of labour to the industries in accordance with their precedence in national importance. The Ministry of Munitions is formulating a method with the assistance of the Ministry of Reconstruction for the discharge into useful channels of the civil war-workers. It is hoped that much assistance will be gained by the co-operation of the trade unions, the associations of employers, and the labour exchanges in the redistribution of the labour power that will be set free.

Labour available, industry can be begun. To manufacture successfully depends upon the supply of raw materials and the finding of a market. We have a great shortage of raw materials, and we shall have to tap all outside sources of supply. Funds—either State provided or bank backing of bills—will be necessary to buy abroad where we shall have to compete with other countries. And having obtained labour and goods, the two need to be brought together. The question of transport, land and ocean, needs settlement. Ships will be required as transports to carry men from the fighting fields home—it must be remembered that in Germany and Austria all the combatants are within only a

day's railway journey from their workshops at the most—and an equipoise must be struck between men and raw materials, and, immediately afterwards, manufactured goods for sale abroad. The Ministry of Reconstruction suggests a freer use of our previously neglected canals and a development of aerial transport, but these are subjects for progress some time after the war.

Distinction has to be made in relative importance. Purely luxury trades will have to give way to those of national import. It is surprising to note how many truly luxury trades have managed to continue making good profits throughout the war. Agriculture is of prime importance. The United Kingdom must be more food self-supporting. To live in dependence on the imports from countries that happen to have a surplus of food has been found almost a suicidal policy. Our land must be farmed and tilled on scientific lines, and old-fashioned prejudices made to give place to established improved methods. No land capable of cultivation can be permitted to remain idle. Farming must no longer be the Cinderella of production. With this development will go rural housing and the repopulation of the countryside. Key industries will have first call upon the labour, shipping, and raw material, that the United Kingdom be not amongst the last in the markets of the world.

Domestic matters will be also of urgent importance. There is a house famine now that will become worse still when six million men are released from the forces. Town planning on garden city lines, with houses that are built for comfort of the residents, is under consideration, and the construction of the "Garden Cities of To-Morrow" will call for much to-be-released labour as well as financial assistance—which assistance has already been promised by the Government to local authorities. The main arterial roads are in need of repair, and it has been said officially that £60,000,000 will be necessary to put them in order. Education and the national health—not a mere day-school to 16 years of age or a panel-doctor scheme—are potent factors. Sound bodies and sound minds will be the only sure foundation of the race in reconstruction.

That, briefly, is the plan to be adopted at home. The Dominions are calling for settlers, but we cannot permit Great Britain to be denuded of its best without offering some inducements to stay. The countries of our Allies that have been devastated by the fighting actually taking place in them must be rebuilt, and Britain needs share in that noble task. Reconstruction cannot have its importance exaggerated. We must prepare for peace whilst the war drags out its end. And, although the ALMANACK is not usually a place for expressing opinion, the opportunity cannot be lost to state that the Ministry needs to be taken from its suggestive stage to an actual constructive footing. Practice must give way to theoretical advice to other Departments. So far as it is able the Ministry of Reconstruction is doing excellent work and tapping every available source for information and suggestion on after-war problems.

ON April 24, 1918, a Bill to amend the Coinage Acts, 1870 and 1891, and to sanction a Decimal System of Coinage, was introduced into the House of Lords by Lord Southwark. It was set down for second reading on June 4, when there was practically no opposition to decimal coinage itself, and finally, on the suggestion of the Government, a Royal Commission was appointed to inquire into the whole question, on the ground that one particular Bill should not be examined to the exclusion of others. Lord Emmott was appointed chairman of the Commission.

Pending the report of the Commission, it may be desirable and expedient to consider a question which has vexed the minds of thoughtful Englishmen from the days when Simon Stevin, the distinguished Flemish engineer and mathematician, advised England to divide her pound sterling into 1,000 parts—the now familiar pound-mil system. For two centuries or more Stevin's advice lay practically unheeded, but prior to the re-coinage of silver and gold immediately after the battle of Waterloo a strenuous attempt was made, both inside and outside Parliament, to persuade the Cabinet that the time was ripe for decimalising our money. The Cabinet was adamant. The struggle between the decimalists and their opponents continued during the succeeding hundred years, during which time other countries had seen the folly of the old system, and many of them had adopted decimal coinage. Canada and the great Republic of the West had previously proved its value; France had shown the way to the Continent of Europe, and countries such as Denmark, Norway, Belgium, and Sweden had followed suit; and many of the British Overseas Dominions had shown a favourable inclination towards the change. We are drawing towards the close of a greater war than that which ended at Waterloo, and another opportunity for establishing a decimal coinage is presented. It has been reported since the war began that when British sailors and soldiers arrived in France, Belgium, Salonika, or Egypt, they were paid in the decimal coinage of the foreign country, and had no difficulty in accommodating their needs to the new monetary system.

It is generally agreed, by both advocates and opponents, that the decimal system of coinage (like that of metric weights and measures) would simplify the work of mankind almost from the cradle to the grave. Think of the "multiplication" which is "vexation" to every child from the moment he enters school until he leaves it, and the waste of brain-power involved in settling long division and multiplication problems that might be made to yield to the magic influence of the decimal point. Think of these problems and worries being carried further on into life in the counting-house, when foreign money has to be translated into the cumbersome terms of £ s. d., and back again into their original form. And this, again, in a country which boasts of having the greatest carrying-trade of the world! Yet such are the advantages of the decimal system,—such clearness of thought does it give in financial matters, especially in discount, sinking fund, depreciation, overhead charges, and costing,—that big firms such as Harrods of London and Kynochs of Birmingham decimalise their accounts for the purpose, although they have to reconvert them to the ordinary system for trading with the outside public. If only the outside public were on familiar terms with the decimal point!

No fewer than five rival systems of decimal coinage hold the field. The "franc-centime" system, although used by 90,000,000 of our Allies, would involve a complete new coinage; and the "shilling-cent" system, which would impair the pound sterling, need not delay us for consideration. In the "florin-cent" system, the next in order of practical value, the present gold and silver coins would be retained, but a new copper coinage would be needed, there would be a four per cent. reduction in the value of equivalent copper coins, and the prestige of the pound sterling would suffer. Next in order of value is the "dollar-cent" system, as used by millions of the English-speaking peoples on the other side of the Atlantic. It has the advantage of retaining our copper coins, but new gold and silver coins would be needed, and the prestige of the pound sterling, on which the vast trade of this country has been built, would again inevitably suffer.

The crux of the decimal coinage problem is therefore this: Shall the pound or the penny go? The Overstone Royal Commission, in its final report in 1859, put the matter concisely when it said, "A decimal coinage founded on the penny necessarily ejects the pound sterling, whilst a decimal coinage founded on the pound must involve all the inconveniences attending the abandonment of the penny." This fundamental difficulty of abandoning the pound or the penny, due to the fact that the penny is not a decimal sub-multiple of the pound, has been largely responsible for the delay in the coming of British decimal coinage; but at last the Institute of Bankers, the Association of Chambers of Commerce of the United Kingdom, and the Decimal Association (which has done splendid pioneer work in the matter) have agreed in joint conference that "a convenient system is available without interference with the existing pound sterling, unchanged in weight and fineness, as our monetary unit. The pound already is universally recognised in the settlement of international transactions throughout the world, and any abandonment, even in name only, of its use as our standard monetary unit would be a voluntary surrender of its acknowledged international goodwill."

The Decimal Association recommends that the existing pound sterling be retained as our monetary unit, and that it be divided into 1,000 parts, called "mils." The complete table of proposed coins would be as follows:—

Coins.	Value in		Equivalent value in Present Currency.
	£	Mils	
Gold or Notes	Sovereign	1'000 1000	Sovereign
	Half Sovereign	'500 500	Half Sovereign
Silver	Double Florin	'200 200	Two Florins
	Florin	'100 100	Florin
	Half Florin or Shilling	'050 50	Shilling
	Quarter Florin	'025 25	Sixpence
Nickel	10-Mil Piece	'010 10	2 1/2 pence
	5-Mil Piece	'005 5	1 1/2 pence
Bronze	4-Mil Piece	'004 4	'96 pence
	3-Mil Piece	'003 3	'72 pence
	2-Mil Piece	'002 2	'48 pence
	1-Mil Piece	'001 1	'24 pence

It will be seen that the total number of our coins is no more, and that all our gold and most of our silver coins are retained. The crown, the half-crown, and the threepenny bit disappear from our coinage system, but the crown, while it is going, could easily be expressed by 250 mills, and the half-crown by 125 mills. Two nickel coins, the 10-mil and the 5-mil pieces, are introduced, and to obviate their confusion with existing silver coins, they could either have a scalloped edge, they could be made square with rounded corners, like the five-cent nickel pieces of Ceylon, or they could be perforated in the middle, like the nickel coins of Belgium.

It is admitted that the greatest objection to the decimal system as outlined above would come on account of its supposed disturbing effect on small transactions and on hourly and piece-work wages rates. Hundreds of thousands of retail dealers, it has been said, are against any change, because they foresee trouble with customers suspicious of the new coins below the value of sixpence. Certain standard charges, it has been pointed out, may have to be re-adjusted, and may cause difficulty—the penny post, for instance, the penny-a-mile railway fare, the penny receipt stamp. Will newspaper proprietors, after the war, charge five mills ($\frac{1}{2}$ pence) or four mills ($\frac{1}{5}$ pence) for the morning papers, and three mills ($\frac{1}{3}$ pence) or two mills ($\frac{1}{4}$ pence) for the evening editions? When the penny post is re-established, will the Government, benevolently inclined, as all Governments should be, carry a letter for four mills ($\frac{1}{5}$ pence) or extract five mills ($\frac{1}{2}$ pence) from the pocket of the overburdened taxpayer? Certain critics of Lord Southwark's Bill seem to have had these objections in their mind when, while supporting the principle of decimal coinage, they pleaded that the decimalisation should proceed upwards from the penny instead of downwards from the pound. It has been admitted by Mr. Theodore McKenna, the chairman of the Decimal Association, that all previous attempts to decimalise the coinage have been met by the argument that it would be against the interest of the working classes, the view being held that it would tend to increase prices if the face value of the smaller coins were raised. "The answer to this argument," he says, "is that quite the opposite effect would be likely to operate. The system that is proposed provides a very much more elastic method of meeting the present increase of prices, and therefore it would be to the benefit of the working classes. At present, if an article which costs a penny goes up in price, it must be raised to three half-pence, there being—for the farthing practically does not count in such circumstances—no coin of intermediate value. But the provision of six nickel or bronze pieces gives five possible gradations of price between a figure slightly under one halfpenny and slightly over twopence, so that the newspaper, the omnibus, and the tram fare, and other things in which the article cannot be reduced in volume or its weight adjusted, can be met if necessary

without an excessive rise in price. That is to the advantage of the working classes and not to their detriment."

Lord Bellhaven and Stenton, the President of the Decimal Association, has also protested against what he calls the "quite fictitious sanctity of the penny." The war, he says, has changed many things, and the value of the penny is among them. "*It is not too much to say that the purchasing power of the penny has completely changed, and that the inflexibility of our subsidiary coinage has been one of the causes accentuating the high prices of daily necessities, which have been found to be the root of so much industrial unrest; and the present proposed changes, instead of being against the industrial classes, will be of advantage to them.* One has only to recall the many instances of the prices of halfpenny goods and services being raised to a penny and of penny goods being raised to three-halfpence for lack of an intermediate coinage to realise the truth of the statement. These advances of 100 per cent. and 50 per cent. respectively have been made when perhaps 20 per cent. would have reimbursed the sellers for their increased cost, and the introduction of new subsidiary coins, having values intermediate between our present halfpenny and penny and between our penny and three-halfpence, would accordingly be a great boon to the consumers of 'pennyworths' in any form."

There is every reason to believe that the substitution of the more finely graded mil coinage for the present penny coinage will bring about a closer relationship between the actual cost of food and other necessities of life, bought in small quantities, and the prices shopkeepers could charge. This is one, and perhaps the most urgent, reason for making the change; but a secondary reason is that the moment is opportune, when there is an abnormal shortage of silver, for withdrawing the crown, the half-crown, and the threepenny-bit from circulation. As to the machinery for giving effect to the reform, the Decimal Association suggests that as the redundant silver coins are withdrawn, the new mil pieces of value lower than sixpence could be issued through the banks and post-offices in exchange for our present bronze money, at the rate of twenty-five mils for each sixpennyworth of "coppers," in pennies, halfpennies, or farthings. All pennies, halfpennies, and farthings not so exchanged, it is suggested, would pass as four, two, and one mils respectively, until withdrawn from circulation.

One word more, and that in the form of a question—Is the term "mil" the best and most appropriate that could be devised for the proposed decimal coins? It has a foreign flavour, and therefore may be unacceptable to many thousands in this country who, in spite of themselves, are under the spell of insular prejudices. Why not "mite"? The story of the widow's mite is known to all of us; and under the new system the "mite" might acquire a newer and an added significance.

Bank Amalgamations.

ONE remarkable factor in the British financial world during 1918 was the policy of amalgamation adopted by the larger banks. There was at one time a feeling of nervousness that the amalgamations were not good for either the nation as a whole or the public and commerce individually. On 28 Feb. Mr. Bonar Law announced the appointment of a Committee to deal with the question, and on 5 Mar. the names of the Committee were announced. Lord Colwyn was Chairman, with, as members, Lord Cunliffe (then Governor of the Bank of England), Hon. R. Beckett, Hon. H. Gibbs, Sir A. Haworth, Captain H. Keswick, M.P., Mr. H. McGowan, Mr. Douglas Vickers, Mr. E. Manville, Sir James Purcell, Sir R. Vassar-Smith, and Mr. John Rae—all well-known gentlemen in commerce and finance.

The instructions to the Committee were:—"To consider and report to what extent, if at all, amalgamation between banks may affect prejudicially the interests of the industrial and mercantile community, and whether it is desirable legislation should be introduced to prohibit such amalgamation, or to provide safeguards under which they might continue to be permitted." After hearing evidence the Committee reported on 22 April that the "possible dangers resulting from further large amalgamations are material enough to outweigh the arguments against Government interference. Some measure of Government control is essential. We recommend that legislation be passed requiring that the prior approval of the Government must be obtained before any amalgamations are announced or carried into effect."

The Chancellor of the Exchequer appointed a Committee of two (Lord Colwyn and Lord Inchcape) to consider applications from bankers for permission to amalgamate, and it is understood that no refusal has been given to any application that has been made. In the meantime the action of the Associated Chambers of Commerce is worthy of notice. A resolution was submitted at their meeting on 20 April, 1918, that "Association views with apprehension the amalgamation of the banks, and considers that they may be injurious." Sir E. H. Holden, Bart., of the London City and Midland Bank, Limited, attended the gathering, and upon his suggestion the resolution was altered to "this Association recognises the need for powerful British banks with resources adequate for the demands of home and foreign trade." And the opinion expressed by Sir C. Addis, of the Bank of England and the Hong Kong and Shanghai Banking Corporation, in July is worth repeating. "We are a long way yet from the setting up of a money trust, and there will be enough competition left between the banks that remain to preserve a free market."

The chief amalgamations have been amongst the members of the London Bankers' Clearing House:—

(a) National Provincial Bank of England, Limited, and Union of London and Smiths Bank, Limited; agreed to in March last.

(b) London County and Westminster Bank, Limited, with Parr's Bank, Limited, agreed to in March.

(c) London City and Midland Bank, Limited, with London Joint Stock Bank, Limited, agreed to last September.

(d) Barclay's Bank, Limited, with London Provincial and South Western Bank, Limited, agreed to in September.

(e) Only twelve months earlier, the London Provincial and South Western Bank, Limited, was formed by the amalgamation of the London and Provincial Bank, Limited, with the London and South Western Bank, Limited (one half proprietors of Cox & Co., France).

(f) Lloyds Bank, Limited, with Capital and Counties Bank, Limited, in August. The London River Plate Bank and the National Bank of Scotland were also included in the arrangement.

(g) Besides actual amalgamation the London City and Midland Bank, Limited, acquired recently the whole of the share capital of the Belfast Banking Company and the London County and Westminster Bank, Limited, the share capital of the Ulster Bank, Limited.

Abroad similar amalgamations are taking place. In July, the Colonial and National Banks of Australasia; March, the Royal Bank of Canada and the Northern Crown Bank—the Canadian Bank Act of 1913 requires all proposed amalgamations to be submitted to the approval of the Finance Minister. From Jan. 1919, the Skauska Handelsbanken and Skandinaviska Kreditaktiebolaget of Sweden. The Anglo-South American and London Brazilian Banks established agencies at the Moseley Street branch of Williams Deacon's Bank, Limited, early in 1918. Likewise there is an arrangement between Barclay's Bank, Limited, with the Colonial Bank, Limited.

Of course, bank amalgamation is only one part of the big question of British banking. Whether it is the best road to perfection is questionable. Personally, the writer would prefer the keeping of the competitive smaller bankers with a big institution for foreign trade. The Federal Reserve Banks of the U.S.A. point the advantages of Central Institutions owned by individual banks that retain their own entities. Even amongst British bankers there is an agreed opinion that the constitution of the Bank of England is archaic, whilst there is considerable feeling on the subject of the Bankers' Clearing House.

BEFORE long New York will be a 24 hours' journey from London by aeroplane, and India a five days' flight. A fast aeroplane flies at 150 miles an hour, and with a high following wind at 200 miles. An interesting table of approximate speeds is given:—

Light & electric telegraph...	186,000 miles per sec.
Shell near muzzle 6 in. gun	2,500 feet "
" from 75 mm. gun	1,600 " "
Sound	1,100 " "
Revolver bullet near muzzle	500-800 " "

Tip of blade of airscrew.....	400 miles per hr.
Fast aeroplane	150 " "
" with high wind	200 " "
Fast motor-car	120 " "
Express train	80 " "
Fast steamship	40 " "
Bicycle (pedalled).....	32 " "
Racehorse	30 " "
Man skating (for a mile)	24 " "
Man running (100 yards).....	20 " "
" a mile	13 " "
" walking	4 " "

1. APPLICATIONS for Foreign Office Passports must be made in the form printed on the back of the Regulations (to be had on application), and inclosed in a cover addressed to "The Passport Office, 59 Victoria Street, London, S.W. 1." They should, if possible, reach the Passport Office not less than seven days before that on which the Passport is to be issued.

2. The charge for a Passport is 5s. Passports are issued between the hours of 10 and 4, except on Sundays and Public Holidays, when the Passport Office is closed. If the applicant does not reside in London, the Passport may be sent by post, and a Postal Order for 5s. should in that case accompany the application. *Postage stamps will not be received in payment.*

3. Foreign Office Passports are granted (1) to natural-born British subjects, *viz.*, persons born within His Majesty's dominions, and to persons born abroad who derive British nationality from a father or paternal grandfather born within His Majesty's dominions, and who, under the provisions of the Acts 4 George II., cap. 21, and 13 George III., cap. 21, are to be adjudged and taken to be natural-born British subjects; (2) to the wives and widows of such persons; and (3) to persons naturalised in the United Kingdom, in the British Colonies, or in India.

A married woman is deemed to be a subject of the State of which her husband is for the time being a subject.

4. Passports are granted (1) in the case of natural-born British subjects and persons naturalised in the United Kingdom, upon the production of a Declaration by the applicant in the form printed at the back of these Regulations, verified by a Declaration made by a member or official of any *Banking Firm* established in the United Kingdom, or by any *Mayor, Magistrate, Justice of the Peace, Minister of Religion, Barrister-at-law, Physician, Surgeon, Solicitor, or Notary*, resident in the United

Kingdom; the applicant's Certificate of Birth and other evidence may also be required in certain cases; (2) in the case of children under the age of 16 years requiring a separate Passport, upon production of a Declaration made by the child's parent or guardian in a Form (B), to be obtained upon application to the Foreign Office; (3) in the case of persons naturalised in any of the British self-governing Colonies, upon production of a letter of recommendation from the High Commissioner or Agent-General in London of the State concerned; and in the case of natives of British India, and persons naturalised therein, upon production of a letter of recommendation from the India Office. Persons naturalised or ordinarily resident in any of the Crown Colonies must obtain a letter of recommendation from the Colonial Office.

5. If the applicant for a Passport be a Naturalised British subject, his certificate of naturalisation must be forwarded to the Foreign Office with the Declaration or letter of recommendation. Naturalised British subjects, if resident in London or in the suburbs, must apply *personally* for their Passports at the Foreign Office; if resident in the country, the Passport will be sent, and the Certificate of Naturalisation returned, to the person who may have verified the declaration, for delivery to the applicant. Naturalised British subjects will be described as such in their Passports, which will be issued subject to the necessary qualifications.

6. Foreign Office Passports are not available beyond two years from the date of issue. They may be renewed for four further periods of two years each, after which fresh Passports must be obtained. The fee for each renewal is 2s.

7. A Passport cannot be issued on behalf of a person already abroad; such person should apply for one to the nearest British Mission or Consulate. Passports must not be sent out of the United Kingdom by post.

THE NEW HEALTH INSURANCE.

AFTER some five years' experience of the working of the National Health Insurance scheme, several changes of importance have now been made by new legislation, designed mainly to improve the benefits granted by the State to all persons who fall within its provisions. No alteration has been effected in the levy—4d. a week from each man and 3d. a week from each woman who is either a manual worker or in receipt of less than £160 a year, and who is between the ages of 16 and 70, together with the employer's contribution of 3d. a week—but all insured persons now receive the benefits (16s. a week in the case of men and 7s. 6d. in the case of women) while incapacitated by sickness after they have been insured for two years, whatever their age may be. During the first two years of insurance, the rates paid are 6s. a week for men and 5s. a week for women.

The maternity benefit of 30s. given to all insured women or the wives of insured men upon the birth of her child is not payable until the person concerned has been insured for 42 weeks and 42 contributions have been paid. An insured person who does not notify his or her "approved society"—the organisations through which the scheme is administered—of the illness within three days only receives benefit from the day following that on which notice is sent, unless a satisfactory explanation can be furnished. Employed contributors who give up their work now

remain insured for all benefits for one year, subject to arrears.

Various new provisions regarding women's benefits came into operation with the new Act. If a woman remains away from work for eight consecutive weeks during the first year of married life she ceases to be insured for the ordinary benefits, but is entitled to draw the maternity benefit of 30s. on her first confinement if it occurs within two years of her marriage. Sickness benefit is also payable at the rate of 5s. a week for not more than six weeks in the year following the date on which she ceased to be an employed contributor. Her right to medical and sanatorium benefit is continued.

A simplified scheme enables an insured person to avoid any reduction of benefits on account of arrears by making a small lump sum payment, and if this is not made benefits are proportionately reduced for the ensuing calendar year. If the number of arrears is not more than four, however, there is no reduction of benefits. Employers of low-wage earners are now required to stamp the contributors' cards at the full rate, but they can recover the penny provided by the State. Under the original Act employers who assumed the responsibility of paying full wages to insured persons in their employ during sickness, paid a reduced weekly contribution. This special arrangement has now been abolished, and all such persons are insured in the ordinary way.

TREASURY NOTES TO CONTINUE.

IMPORTANT proposals regarding our currency system after the war were made by a committee of banking experts, under the chairmanship of Lord Cunliffe, set up to enquire into the various financial problems that will require solution when normal conditions become possible. It is well known that, as a consequence of the war, the conditions necessary to the maintenance of the gold standard, which the country previously possessed, have ceased to exist, owing to the growth of credit caused by Government borrowing for war needs. The committee expressed the opinion that it is imperative that these essential conditions should be restored without delay after the war; otherwise there would be grave danger of a foreign drain of gold, menacing the convertibility of our note-issue, and so jeopardising the international trade position of the country. To retain an effective gold standard the cessation of Government borrowing, as soon as possible, was urged, together with the provision, out of a revenue, of an adequate sinking fund at the earliest possible moment, so that there might be a regular annual reduction of capital liabilities. The raising and making effective of the Bank of England discount rate was recommended. A question in which every member of the community, and not the financier alone, is interested is the issue of notes. Upon this the committee considered that the issue of fiduciary notes should once more be limited by law, and that the note issue (except as regards existing private issues) should be entirely in the hands of the Bank of England. Before this could be done, however, the future dimensions of the fiduciary issue would have to be ascertained, and during the transitional period the familiar Treasury notes should remain a Government issue, new

notes not being issued against Government securities, but against Bank of England notes. While the obligation to pay bank notes and currency notes in gold on demand should be maintained, the committee were of opinion that it was neither necessary nor desirable that there should be any early resumption of the internal circulation of gold coin. On the contrary, they thought that all gold and bullion should be concentrated in one central reserve at the Bank of England.

The maintenance of the principle of the Bank Charter Act, 1844—that there should be a fixed fiduciary issue beyond which notes should only be issued in exchange for gold—was recommended, except in cases of emergency, when the Bank of England, with the consent of the Treasury, should be empowered to issue notes in excess of the limit. It was not deemed practicable to fix any precise figure for the fiduciary note issue immediately after the war, but Lord Cunliffe and his colleagues agreed that it was advisable to suggest the amount which should be aimed at as the central gold reserve. In the first instance they proposed that this reserve should be 150 millions. Until this figure was reached, and maintained, concurrently with a satisfactory foreign exchange position for at least a year, the policy of cautiously reducing the uncovered note issue was recommended, the position being reviewed when the exchanges worked normally on this minimum reserve basis. Only when the fiduciary portion of the issue had been reduced to an amount consistent with the maintenance of a central gold reserve of 150 millions, it was declared, should the outstanding currency notes be retired or replaced by Bank of England notes of low denomination.

IMPERIAL PREFERENCE.

THE policy of Imperial Preference, especially as a weapon against German trade after the war, has attracted a great deal of attention and gained new adherents in recent months as a direct outcome of the war and its results. Neither the Imperial War Conference nor the Imperial War Cabinet dealt with the subject last year, but in 1917 both bodies expressed themselves in favour of "the principle that each part of the Empire, having due regard to the interest of our Allies, shall give specially favourable treatment and facilities to the produce and manufactures of other parts of the Empire." The main object held in view by both Conference and Cabinet in adopting this attitude was to make the Empire independent of other countries in respect of food supplies, raw materials, and essential industries. The same end was in the minds of Lord Balfour of Bute's Committee on Commercial and Industrial Policy after the war, in recommending in their final report, published last year, that preferential treatment should be accorded to the British Oversea Dominions and Possessions in respect of any Customs duties imposed, now or hereafter, in the United Kingdom. This proposal is the more significant because the Committee (which was set up by Mr. Asquith) did not think it expedient to establish a comprehensive tariff scheme, and, while advising protection by means of Customs duties to carefully selected branches of industry, urged that this help should only be given on the advice of a strong, independent,

competent Board, which should at the same time consider other forms of State assistance and safeguard the interests of consumers and labour.

A further step towards the adoption of the principle was taken when a Committee was appointed by our own War Cabinet to consider the question of trade within the Empire after the war; and the Colonial Secretary announced last year that this body had decided on a scheme adopting preference within the Empire, which had been approved by the War Cabinet. A second Committee, he added, had produced a clearly worked-out plan to put this policy in effect, and this also had met the sanction of the Government. No details have yet been given of the proposals beyond the statement that the Committee had dealt with the question of raw materials so as to secure them for the Empire in the first instance, while it has also been definitely declared by the Government that the policy does not involve a tax on food and is not fatal to the scheme of a League of Nations. As an illustration of what is possible in the direction of Imperial Preference, an example set by one of the Dominions may be cited. The New Zealand Parliament some time ago provided that, by Order in Council, Customs duties on goods from present enemy countries might be increased by 50 per cent. as compared with the duties in existence before the war, and it is regarded as almost certain that this provision will be put into operation when the war comes to an end.

THE CHANNEL TUNNEL.

THE strengthening in the fires of war of the links of friendship and commerce that unite Great Britain and France has appreciably advanced the prospects of the Channel Tunnel. In both countries the project has gained many new adherents, and preparations are in a forward state for proceeding with its construction when circumstances render the task practicable. The International Parliamentary Commercial Conference during the past year adopted a resolution suggesting to the British and French Governments that, in view of "the advantages which would accrue from increased facilities for the transport of passengers and goods between the two countries," the work should be commenced as soon as possible. This motion was warmly supported by the Italian delegates, as well as the French, one spokesman declaring that the Italian Section of the Conference considered the Tunnel indispensable to future intercourse between the three great democracies of Great Britain, France, and Italy.

The supporters of the proposal have recently examined the war aspect of a submarine railway beneath the Straits of Dover. They suggest that the Tunnel should be maintained under the authority of the War Office, and that the dip in the level of the rails—forming a water-lock, by which, in case of emergency, the Tunnel could be filled with water from floor to roof for a mile—should be under the control of the Commandants at Dover Castle and the neighbouring forts. With respect to the danger of attack from submarines, depth-bombs, or mines, it is claimed that the Tunnel could be protected by a "cover" of the chalk bed of the Channel of a minimum of 100 feet in thickness, in addition to a water depth of from 160 to 180 feet above the sea-bed.

It is estimated that the Tunnel could be completed in a period of five years. It would be worked, ventilated, and pumped by electricity supplied from a power station in Kent, possibly ten miles or more inland. Sir Arthur Kell, M.P., for many years the leader of the movement, is of opinion that the existence of a tunnel railway would increase the passenger traffic from France alone to 3,000,000 a year, while the effect of the new conditions upon goods traffic between Great Britain and the Continent generally would probably be even greater. In the coming commercial war with the German Empire the effect upon Allied trade of the establishment of a through and speedy means of transport for the products of the three chief European partners, as well as for those of the United States upon their arrival on this side of the Atlantic, is unquestionably deserving of the most serious consideration of the Governments concerned.

It has been stated that the conveyance of goods from Le Havre to Southampton or London, for instance, necessitates practically the same packing as for New York or Australia, while the freight charges to New York were frequently less than those to a French port. The institution of the Tunnel would, moreover, foster trade between Great Britain and France by placing the communications between the two nations on an equality with the pre-war conditions of France and Germany, thus removing the disparity that prevailed in the period before hostilities put a stop to commercial relations, when trade between this country and the Republic increased to only half the extent of that between the countries which had the advantage of direct communication across the French frontier.

THE SMALL TENANTS' CHARTER.

LARGELY as the result of the War Rents League, a body called into existence to meet a real need, Parliament at the end of 1915 passed without a division and brought into immediate operation a measure to prevent, until six months after the war ends, the increase of rents and mortgage interest on small dwelling-houses beyond the amounts that had been paid before the outbreak of war. The original Act—for its provisions have since been strengthened—applied to dwelling-houses, tenements, flats and apartments let unfurnished, where either the annual amount of the standard rent or the rateable value of the house or rooms did not exceed £35 in the Metropolitan Police District, £30 in Scotland, and £26 elsewhere in the United Kingdom. The effect was that no tenant could be legally compelled to pay more for his dwelling than the rent at which it was let before the war, and as the rent was conferred upon the dwelling, and not upon the tenant, new tenants enjoyed the same benefit. Landlords were further prohibited from seeking to make a tenant who paid an inclusive rent pay the rates direct. So long as a tenant paid the standard rent and performed the other conditions of his tenancy, no order for the recovery of possession of a house or rooms to which the Act applies could be made.

The latter provision left a loophole which resulted in the passage of an amending measure last year. An order for recovery was permissible, originally, on the ground that the

premises were reasonably required by the landlord for his own occupation or that of some person in his employ. The air raids upon the London district resulted in many persons seeking homes in neighbourhoods less likely to suffer from enemy action, and in order to evade the Act many of these bought houses to which it applied, and, becoming in this way the landlords, sought to turn out the old occupants because they required to live there themselves. To prevent this a new Bill was introduced by the Government, and passed, depriving persons who had purchased houses after Sept. 30, 1917, of the right to evict tenants on the ground that they needed the houses for their own occupation or that of their servants. An exception was made in favour of cases where the Board of Agriculture certified that the premises were required for the occupation of persons engaged in agricultural work of urgent national importance.

The War Rents League has since continued a useful existence, although the Legislature had carried out its objects. Many tenants were ignorant of their rights, and the organisation has assisted thousands of persons whose landlords attempted to make increases of rent illegally, besides securing the introduction in emergency legislation of clauses designed to correct abuses and evasions. Instead of concluding its work, the League is preparing to take care of the tenants of small houses after the war, when new problems may arise with the return to civil life of our fighting men.

COLONIAL APPOINTMENTS (For INDIAN APPOINTMENTS, see p. 512).

APPOINTMENTS in the self-governing Dominions—Canada, Australia, New Zealand, the Union of South Africa, and Newfoundland—are entirely under the control of the local Governments, and for information with regard to them application should be made to the *High Commissioners* or *Agents-General* in London, particulars of whom, with their addresses, will be found under the respective Dominions in the ALMANACK. With regard to appointments of a Consular nature, application should be made to the *Foreign Office*. Inquiries as to appointments in Egypt and the Sudan should be addressed to the Secretary, Selection Board, Ministry of Finance, Cairo. Aden and adjacent territories are subject to the Government of Bombay. Ascension Island is under the supervision of the Admiralty. All civil officers of Rhodesia are either nominated or appointed by the British South Africa Company, 2 London Wall Buildings, E.C. For appointments in North Borneo, application should be made to the British North Borneo Company, 37 Threadneedle Street, E.C. Appointments in Sarawak are in the hands of His Highness the

Rajah. The patronage of the Secretary of State for the Colonies is confined to those colonies and countries which are administered under his direction.

The selection of candidates depends on the general educational attainments, the professional or otherwise subsequent training and experience (if any), and on the character and personal fitness of the applicants. These qualifications are judged by the candidate's academic record, by testimonials from properly qualified persons who have a personal knowledge of the candidate and his career, and by personal interviews at the Colonial Office.

Attempts to influence the Secretary of State's selection through Members of Parliament or other persons who are not personally well acquainted with the applicant are useless, and will be regarded as indicating that the applicant himself does not consider his qualifications sufficiently good to justify his appointment on his own merits. They can in no case operate to the advantage of a candidate, and may prejudice his chance of success.

War Medals and Decorations.

THE war medal, as we understand it, is only a century old. Waterloo (1815) was the first occasion upon which a medal was issued to officers and rank and file also. The award was not made spontaneously by the Regent or his Ministry. Much petitioning was necessary, the Duke of Wellington in his application putting forth the plea that the medal would have a good effect upon the Army. The medal, which was given to survivors, was of silver, with the head of the Prince Regent on the obverse and a design of Victory on the reverse, and was hung from a ribbon of blue with red edges. The Prussian Waterloo medal had a ribbon of blue, yellow, and blue stripes. From Waterloo, every successful British campaign has been marked by the distribution of a medal, but never since has a medal been struck for one particular battle.

Early Medals and Definition.—Ancient Rome is said by some (experts differ) to have awarded medals in bronze, silver, and gold to her famous soldiers. However, it is not until the fourteenth century that the military medal is really met with. Possibly the division of the spoil amongst the victors was considered sufficient mark for service. The knighthood conferred upon the field of battle, the flag, and war cry may be taken as the precursors of the medal proper. China is said to have had military medals during the Han dynasty (1-100 A.D.). A medal is defined as a piece having no place in the currency struck to commemorate some event or person.

Armada.—The defeat of the Spanish fleet (1588) was made the occasion by Elizabeth of an issue of gold and silver medals. The design gave the medals the name of "Ark in Flood." They were issued with gold and silver rings and chains, with which they were worn. James I. continued the idea. In 1643 Charles I. authorised medals to be given to his followers if the Commander-in-Chief considered "faithful service in the forlorn hope" to have been rendered. And Cromwell followed with a medal (his shape was oval, not circular) for those who took part in the Dunbar "crowning mercy." Medals were handed to the volunteers in Holland during 1623-3. Gustavus Adolphus of Sweden provided a military medal in 1620.

Prize Money.—For a long period gold medals were given to successful commanders. Parliament decided in 1602 that one-tenth of all naval prize money should be set apart for medals and other awards. But the men did not share in the distributions. It was thought "expedient" to institute a naval medal following Earl Howe's victory of June 1, 1794. Marlborough's wars did not bring him or his warriors medals. The Seven Years' War and that of American Independence were entirely without medals. The first Indian medal (the Deccan) awarded to all ranks dates from 1784.

Naval Medals.—For all naval victories between 1787 and 1815 only 139 medals were conferred by the Government during those years. However, the survivors of Nile and Trafalgar were not permitted to go empty-handed. Two men, Davison and Boulton, whose business was connected with the Navy, found the funds to buy medals for the men. Many years afterwards (1847) Queen Victoria instituted the Naval General Service medal, and had an issue made to the survivors of the glorious years of 1793-1840.

Army.—At the same time, the Peninsular medal made its appearance, and was given to the survivors of the Napoleonic campaign. The ribbon (red, with blue edges) carried twenty-eight clasps, the first being Egypt, 1801. Gold medals had been conferred upon officers taking part in the Peninsular battles, and the Government, on ascertaining that some officers would be entitled to two or three decorations, ordered that for all medals over one a clasp only should be given for those subsequent. Separate medals were struck for Indian battles (1799 onwards), Kafir (1833-5), and Acre (1840). A star suspended by a rainbow ribbon was issued for the Gwalior (1842) fighting. This star was known by the writer to be worn as late as Sept., 1915, by Private Adams (æt. 93). Medals and grants began to be issued in 1830 for long service and good conduct. Then followed Meritorious Service, 1845; Conspicuous Gallantry (Navy), 1854; Distinguished Conduct on the Field, 1854 (ribbon has red, blue, and red stripes).

Order.—War medals are worn on the left breast; for saving life in peace, on the right. Their order from the centre of the breast is first those for bravery (V.M.), then orders of knighthood, British war medals in order of receipt, foreign orders, and foreign war medals. The clasp for the earliest engagement is worn nearest the medal. If a second or third war takes place in a country and a medal and ribbon is in existence for the first, that is adopted usually for the others; holders of the early medal get clasps for the additional battles. The frontier campaigns of India are marked by clasps to one of the four Indian General Service medals.

Ribbons.—The principal medals and ribbons worn for recent campaigns are as follows. The ribbons for the V.M. and other British orders will be found earlier in this volume under Orders of Knighthood. (Contraction: s. = stripes.)

Mons (1914)—Red, white and blue, watered. Naval General Service (1909)—White, with crimson borders and two crimson s.

Indian Gen. Ser. (1908)—Dark blue, edged green. Thibet (1903-4)—Purple, edged green and white. China (1901, 1856-60, 1842)—Yellow, red centre. Transport (1899-1902)—Red, two black s.

Boer (1899-1902)—

Victoria: Red, blue, orange, blue, red s.

Edward: Green, white, orange s.

Indian Gen. Ser. (1895-1908)—Red, two green s. African Gen. Ser. (1895-8)—Red and yellow halved.

Sudan (1896)—

British: Yellow and black divided by red s.

Khedive: Yellow, blue, and yellow s.

Ashantee Star (1895)—Yellow, two black s.

Indian Gen. Ser. (1852-95)—Green, red borders.

Matabele (1893)—Four orange and three blue s.

E. and C. Africa (1891-4)—Brown, white, black.

Burmah (1885-7, 1852-3)—Red, two blue s.

Canada (1885)—Light blue with two red s.

Egypt (1882-3)—

British: Blue, white, blue, white, blue s.

Khedive (Star): Blue.

FRENCH.—Legion of Honour—Crimson.

" Military Medal—Yellow, green edges.

" War Cross—Green, seven red s.

BELGIAN.—War Cross—Red, five green s.

" Military Cross—Green, red borders.

NOTABLE RAILWAY ACCIDENTS SINCE 1853 RESULTING IN LOSS OF LIFE.

TRANSPORTING THE AMERICANS.

No achievement of the British Navy and the British Merchant Service during the war is more notable than the transport to Europe of the American troops, with their equipment and food. Week by week a steady stream of reinforcements has been safely brought across the Atlantic despite the ruthless U-boat warfare, and the loss of life has probably been smaller proportionately than that occurring in the ordinary course of voyages between the New World and the Old in the days before the war. Up to the end of last September—eighteen months after the Western Republic's entry into the campaign—no fewer than 1,766,160 American soldiers had been brought across the Atlantic and landed in Great Britain and France. The total for that month was 311,219, in addition to 5,000 Canadians and 4,000 American bluejackets, compared with 317,000 in July, the record month.

The part played by British sailors in this great accomplishment can be shown in two ways. Of the month's arrivals, 175,721—57 per cent.—were brought in British and British-controlled ships, against 121,547—39 per cent.—in American vessels; while of the full number 946,000 came in British or British-controlled ships, and 786,000 in American boats. As to the conveying, the British Navy performed as much as 70 per cent., the American Fleet 27 per cent., and the French Navy 3 per cent. How efficiently this work was performed will be realised when it is remembered that of the first million American soldiers brought to Europe, fewer than 300 were lost, notwithstanding that the enemy was able to combine his original plans for attempting to starve out England by his submarine service with his effort to attack the troopships.

Mammoth as are these totals of men despatched to the fighting line in France and Flanders, they do not represent the whole of the task. Unless those soldiers could be supplied with all that they required, the majority of them might as well have remained in the United States. But all kinds of material—guns, aeroplanes, wagons, ammunition, food, for example—have also been brought across the Atlantic to make them an effective fighting weapon. In one month last year, half a million tons of stores for the American armies were shipped and safely disembarked on this side. Every week, as the strength of Gen. Pershing's Expeditionary Force grew, a larger quantity of supplies was necessary. Splendid organisation both in Great Britain and in the United States has enabled the problem to be met, without interfering with the exports of food for our own Army and civilians, which in one month included nearly a hundred million pounds of beef and close upon three hundred million pounds of pork.

The work of the Allied Maritime Transport Council has greatly facilitated the smooth working of the arrangements, and the United States Secretary of War, Mr. Newton D. Baker, attended one of the sessions of this body in the autumn, when the supply programme for the American Army was considered in conjunction with the other tonnage requirements of the Allies, important agreements being reached as to the disposition of ships between the various services during the succeeding year. But, beyond everything, it was the untiring vigilance of British sailors, bluejackets, or merchantmen that placed the new reserve of keen young soldiers at the disposal of Marshal Foch for his hammer blows against a staggering enemy.

THE PRICE OF SILVER.

DURING the summer of 1917 an extraordinary rise occurred in the price of silver bullion. Certainly, the world supply was not equal to the demand, but whether the high prices were justified is doubtful. The powers possessed by the Government were strong enough to have permitted control of the London silver market, and it is surprising that the Treasury did not take over silver in the same sense as it has done with various articles of munitions of war.

China and India are absorbing silver continuously. The war has introduced a new demand for silver coinage at home and abroad. Wherever troops have gone, large quantities of silver coinage have been required. The actual turnover of money has been much greater than in pre-war times, thus calling for small change.

The shortage has been felt throughout the world. In Aug., 1917, the U.S.A. were exchanging paper money for the silver coin of Panama. On 6 Sept., 1917, the export and import of silver was prohibited by the Government of India. The rise in price has had a corresponding effect on Exchange rates between London and the Far East. At the end of 1915 the value of a Hong Kong dollar was 1s. 10d. On 25 Sept., 1917, it was worth 3s. 3d. On one occasion, the price of silver fell in London 9½d. per oz. in 12 days (26 Sept.—8 Oct.). Naturally, with high prices for bullion, the Mint has not been able to make so much profit on the silver coinage produced.

Here are the chief prices of silver in London. A date in brackets signifies that on which the same price was reached previously:—

DECREASED DRUNKENNESS.

AFTER operating for three years, the Central Control Board (Liquor Traffic) has been able to report steady and continuous progress in the direction of reducing drunkenness and its attendant evils, the decrease of the former amounting to approximately one-quarter of its previous amount. The improvement effected is, indeed, so appreciable that the Board considers that there is no such inherent difficulty in the problem as to render impossible the permanent maintenance of the present level of sobriety. Lord D'Abernon, who has throughout been the Chairman of the Board, declared not long ago, in reviewing the situation, that not only had there been an astonishing decrease among women of all offences attributable to drunkenness—and an extraordinary fall in sickness and mortality—but coincidentally there had been an immense improvement in the care and health of children. This he considered to a very large extent due to the increase of workers' wages, but partly to the fact that a smaller proportion than formerly of these wages was now spent in drink. The opinion has been expressed that the country has now reached low-water mark in respect to drunkenness, and that not even total prohibition would bring about any further appreciable reduction in the number of charges for the offence.

Figures speak effectively in a problem of this character, and nothing could be more satisfactory than the fall from 67,654 in 1914 to 16,667 in the Board's third year of operations of the convictions for drunkenness in Greater London, and the corresponding decline from 49,835 to 13,549 in 36 of the boroughs of England and Wales. The weekly average of convictions in Great

Britain dropped from 3,956 to 1,200 in the same period. The statistics regarding female drunkenness are particularly striking. In Greater London in 1914 there were 18,577 convictions for drunkenness of females, and in the 36 boroughs 11,258 convictions; three years later the totals had been reduced to 5,734 and 3,679 respectively—and this despite the higher wages paid in every industry. Again, before the Board came into existence, the number of deaths certified as due to or connected with alcoholism was 1,116; after three years the total had fallen to 580. How far these reductions can be traced to the work of the Board and how far to the restrictions upon the output of liquor cannot be decided, but the improvement in the country's sobriety was noticeable before it was found necessary to conserve food by limiting the consumption of beer and spirits—matters which, by the way, form no part of the Board's policy.

The positive side of the work has been extended beyond the closing of licensed premises, 168 of which have been dealt with in this manner in Great Britain. The Board is now responsible for hundreds of industrial canteens at munition works and other controlled establishments, no fewer than one million persons being catered for. They consider that the future of the canteen movement is assured and that it is a constructive contribution to the solution of the drink problem. In four munition areas, licensed premises are at the present time being run by the Board. In these the facilities for the consumption of intoxicants except with food have been restricted, and the result has been excellent, both from a financial point of view and in regard to increased sobriety.

THE VISIBLE HORIZON.

THE limit of vision at any given point varies with the height at which the spectator is placed. The greatest distance at which an object at sea-level (or on the surface of a plain) can be seen by a person whose eyes are at a height of 5 feet from the same level is $2\frac{3}{4}$ miles, and at 10 feet the distance is increased to 4 miles; at 20 feet to $5\frac{1}{2}$ miles. The radius of vision does not increase in the same proportion as the height, the increase between the visibility at 5 feet and 6 feet being half a mile, but between 19 and 20 feet only one-sixth of a mile. The following table shows the approximate range of vision at different heights:—

At a height of 5 feet the radius is about $2\frac{3}{4}$ miles					
10	10	10	10	10	10
20	20	20	20	20	20
30	30	30	30	30	30
40	40	40	40	40	40
50	50	50	50	50	50
100	100	100	100	100	100
500	500	500	500	500	500
1000	1000	1000	1000	1000	1000
2000	2000	2000	2000	2000	2000
3000	3000	3000	3000	3000	3000
4000	4000	4000	4000	4000	4000
5000	5000	5000	5000	5000	5000
5280 feet (1 mile)	5280	5280	5280	5280	5280

Objects which are themselves raised above the level are visible at proportionately increased distances, according to the height at which they stand.

THE FRENCH REPUBLICAN CALENDAR.

THIS, although reckoned from the 22nd September, 1792, was not introduced until the 22nd November, 1793. It remained in use only till the 31st December, 1805* (Nivôse 10, Year XIV.). The Gregorian Calendar was restored January 1st, 1806. The months varied in different years, thus Nivôse 1 commenced December 21st in 1793, December 22nd in 1795, December 21st in 1796, December 22nd in 1799, December 23rd in 1803, and December 22nd in 1804 and 1805. The following are the dates for the year 1804, the last complete year of the Calendar:—

1804 Vendémiaire (<i>Vintage</i>), 23 Sept. to Oct. 22	Germinal (<i>Budding</i>), 22 Mar. to Apr. 20
Brumaire (<i>Foggy</i>), 23 Oct. to Nov. 21	Floralé (<i>Flowery</i>), 21 Apr. to May 20
Frimaire (<i>Sleety</i>), 22 Nov. to Dec. 21	Prairial (<i>Pasture</i>), 21 May to June 19
Nivôse (<i>Snowy</i>), 22 Dec. to Jan. 20	Messidor (<i>Harvest</i>), 20 June to July 19
Pluviôse (<i>Rainy</i>), 21 Jan. to Feb. 19	Thermidor (<i>Hot</i>), 20 July to Aug. 18
Ventôse (<i>Windy</i>), 20 Feb. to Mar. 21	Fructidor (<i>Fruit</i>), 19 Aug. to Sept. 17

The months were divided into three decades of ten days each, but to make up the 365, five were added at the end of September; (*Primidi*), dedicated to Virtue; (*Duodi*) to Genius; (*Tridi*) to Labour; (*Quartidi*) to Opinion; and the 5th (*Quintidi*) to Rewards. To Leap Year, called *Olympic*, a sixth day, the 22nd or 23rd September (*Sextidi*), "Jour de la Révolution," was added. This variation of dates has led to considerable confusion, but those who may wish to trace the fourteen years will find some very elaborate tables in the English edition of Bourrienne's "Life of Napoleon": Bentley.

* 31 December, 1805=10 Nivôse, Year XIV., the last day of the Republican Calendar.

Tithe Commutation.

THE average Tithe Rent Charge for the first fifty years from 1836 was £102 9s. 9½d., and for the past eight years (1910-1917) £77 2s. 9½d.

AVERAGE WEEKLY EARNINGS OF RAILWAY SERVANTS.

THE following table shows the *average wages per head* of workpeople employed in the coaching, goods, locomotive and engineer's departments of the 27 principal Railway Companies of the United Kingdom during the first or second week in December in each of the years 1901-1913. The Companies included in the table employ over 90 per cent. of the total number of Railway servants.

In the first half of the seventeenth century (1633 has been cited as the best approach to a definite date) we meet with the earliest mention of the introduction of *rails* for the lessening of friction upon roads. Beams of wood, some six or seven inches in breadth, were about this time laid down to facilitate the draught of the waggons in the vicinity of some of the coal-mines at Newcastle; and as a matter of necessity the addition of "sleepers" had speedily to follow. In 1738, at Whitehaven, it is stated that iron was first substituted as the material of the rails; and in 1767 it appears established that this revolution was adopted at Coalbrookdale, being followed nine years later at the Sheffield Colliery. As yet, however, only thick plates of iron were fastened to the surface of the wooden rails, and it was not till 1789 that "edge rails" were introduced, the credit of their adoption being assigned to William Jessop, on the Loughborough and Nantpantan line. James Watt had conceived the idea of utilizing steam for locomotion, and there is a record of a model locomotive having been used in Cornwall in 1784. George Stephenson, however, in the year 1825, was the first to bring the project fairly into practical shape.

The first Act obtained for the construction of a railway was that of the Surrey Iron Railway Company in 1801, for a line $9\frac{1}{2}$ miles long from Wandsworth to Croydon. In 1804 an Act was passed "for making and maintaining a railway or tramroad from the town of Swansea into the parish of Oystermouth, in the County of Glamorgan, and for the hauling or drawing of waggons or other carriages passing upon the said railway or tramroad with men, horses, or otherwise." On the 21st of February, 1804, Trevithick's patent locomotive steam engine was tried at Penydarran, near Merthyr, and conveyed along a tramroad 10 tons of bar iron, and about 70 persons, a distance of 9 miles. The application passed the third reading as a railway or tramroad. The word "otherwise" was evidently intended to cover the use of Trevithick's engine, and this Act may therefore be considered the first in which steam was contemplated as the motive power. The line is now known as the Swansea and Mumbles Railway. Then followed the Kilmarnock and Troon, the Severn and Wye, the Gloucester and Cheltenham, Plymouth and Dartmoor, Stratford-Avon and Moreton, and other small undertakings, about twenty-five in number altogether, with an aggregate of 325 miles, and an authorized capital somewhat over a million. It is almost unnecessary to add that animal power only was contemplated in their working. The Stockton and Darlington Act was obtained in 1821, with a capital of £102,000; and it is remarkable that, while animal power was to be relied upon for working the line, the clause in the Act states "with men and horses or otherwise." George Stephenson came upon the scene immediately after this Act was obtained, and was appointed engineer of the line; and at his urgent request, Edward Pease, the promoter, applied for a new Act empowering the company to work the railway with locomotive engines. Great opposition was encountered, but the Bill finally passed in 1823, and the line, which was 25 miles in length, was opened on the 27th of September, 1825. The Monkland and Kirkintilloch Railway, a colliery line near Glasgow, opened in 1826, was really the first to follow the example of the Stockton and Darlington, and several other small lines—many

of them worked partly by fixed and partly by locomotive engines—quickly adopted the new traction power. The inauguration of the Liverpool and Manchester line in 1830, attended as it was with a tragic result, was the first to impress upon the people that a revolution in travelling had really taken place. Leicester to Swannington came next, but that from London to Birmingham was the largest that had yet been projected. A great struggle took place with landowners and other influential personages, opposed not only to this Bill in particular, but to the introduction of railways generally. Undaunted courage and perseverance on the part of the promoters prevailed, and the Bill, which was rejected in 1832, passed in 1833, but not until landowners and others had been conciliated by having the price originally estimated for their land, &c., doubled and even trebled. The expenses of carrying this Bill, which was probably the most momentous Parliamentary campaign in the history of railways, were over £70,000. The line was opened throughout in 1838, and the first train accomplished the distance at an average speed of over twenty miles an hour. The tide of public opinion was now fairly turned, and ran as strongly in favour of railways as it had before been against them. The Grand Junction, the London and Greenwich, London and Southampton, the Great Western, Birmingham and Derby, Bristol and Exeter, Eastern Counties, Manchester and Leeds, Midland Counties, North Midland, South Eastern, London and Croydon, Birmingham and Gloucester, together with a large number of small Bills, were all passed in four years from the passing of the London and Birmingham Bill, and before that line was opened.

Up to 1840, inclusive, 299 Acts, authorizing the construction of 3,000 miles of line, had been passed. The inevitable reaction set in, and in 1841-2-3 only a few small Bills were passed by the Legislature; but as the Liverpool and Manchester, the London and Birmingham, and other leading concerns were paying 10 per cent. dividends, and some of the smaller lines were yielding even larger returns, attention was naturally drawn to the remunerative character of this class of property, and the supply of railway shares became far below the demand. A flood of new projects appeared before the public, and the Legislature even, labouring apparently under the general excitement, encouraged promoters by relaxing or withdrawing the general opposition which had previously been offered. In 1844, 797 miles were authorized; in 1845, 2,883 miles; and in 1846, the prodigious total of 4,790 miles, under no less than 272 Acts, obtained Parliamentary sanction. The succeeding years saw some abatement, but still there were 1,663 miles passed in 1847, and 300 in 1848. These figures illustrate the rise and fall of the great fever known as the "railway mania."

The Railways Regulation Act of 1840, the first of the General Acts, provided for a month's notice being given to the Board of Trade before opening; for returns of traffic to be made by the companies, as also of accidents involving personal injury; for Government inspection of works, for the approval of bye-laws, &c. Afterwards were passed Acts for their better regulation, and for the conveyance of troops, 1842, the Railways Further Regulation Act of 1844, the Railways Clauses Consolidation Act, 1845, and the Canal and Railway Carriers Act of the same session.

Then followed legislation on the leasing and sale of railways, on the gauge, on cheap trains, passenger duty, &c.

When war was declared, the Government took over the home railways. The following is an extract of announcement issued from the War Office:—

“WAR OFFICE, Aug. 4th, 1914.

“An Order in Council has been made under Section 16 of the Regulation of the Forces Act 1871, declaring that it is expedient that the

Government should have control over the railways in Great Britain. This control will be exercised through an Executive Committee composed of general managers of railways which has been formed for some time and has prepared plans with a view to facilitating the working of these provisions of the Act.”

TERMS OF REMUNERATION.—The Board of Trade issued the following notice, dated September 15th, 1914:—

“The Regulation of the Forces Act 1871, under which His Majesty's Government have

taken possession of most of the railways of Great Britain, provides that full compensation shall be paid to the owners for any loss or injury they may have sustained thereby, the amount of such compensation to be settled by agreement, or if necessary by arbitration.

"His Majesty's Government have agreed with the railway companies concerned that, subject to the undermentioned condition, the compensation to be paid them shall be the sum by which the aggregate net receipts of their railways for the period during which the Government are in possession of them fall short of the aggregate net receipts for the corresponding period of 1913. If, however, the net receipts of the companies for the first half of 1914 were less than the net receipts for the first half of 1913, the sum payable is to be reduced in the same proportion." [On April 14th, 1915, the Board of Trade announced that an alteration had been made in this agreement by which the proportionate reduction in net receipts of the companies referred to will not in future be made, but 25 per cent. of the war bonus granted to railway employees who come within the Railway Conciliation Scheme shall be borne by the

* Sir Robert Turnbull acts for Sir Guy Calthrop, Bt.,

railway companies, and not by the Government.]

"This sum, together with the net receipts of the railway companies taken over, is to be distributed amongst those companies in proportion to the net receipts of each company during the period with which comparison is made.

"The compensation to be paid under this arrangement will cover all special services, such as those in connection with Military and Naval transport rendered to the Government by the railway companies concerned, and it will therefore be unnecessary to make any payments in respect of such transport on the railways taken over."

THE RAILWAY EXECUTIVE COMMITTEE.

On behalf of the Government, the control of the railways in Great Britain was vested, as from Aug. 5th, 1914, in a Committee composed of the following General Managers:—

Sir J. A. Aspinall L. & Y. Rly.

Sir A. K. Butterworth N.E. Rly.

*Sir Robert Turnbull, M.V.O. L. & N.W. Rly.

Mr. C. H. Dent G.N. Rly.

Sir F. H. Dent S.E. & C. Rly.

during the latter's absence as Controller of Coal Mines.

RAILWAYS IN 1913, 1914, 1915 and 1916.

The number of persons employed in working the railways of the United Kingdom in 1914 was 643,135, and there were in use 24,818 locomotive engines, 79,539 coaching vehicles, 759,910 waggons for the conveyance of live stock, minerals, and general merchandise, and 49,629 service vehicles. A large number of locomotives have been sent overseas for war service, but details cannot be provided.

Capital embarked in Railways.—The total amount of capital authorized by Parliament to be raised for the construction of railways in the United Kingdom amounted on the 31st December, 1916, to £1,447,557,000. Of this sum, £1,349,219,000 (which includes £199,569,000 nominal capital caused by the consolidation or conversion of stocks) exists and forms the capital account of the various railway companies, and shows an increase over the year 1915 of £1,907,000, or 0.1 per cent. The £1,349,219,000 is composed of £124,351,000 guaranteed, £354,093,000 debenture, £362,568,000 preferential, and £494,496,000 ordinary stocks and shares, besides a sum of £13,711,000 raised by loans. The net receipts for the year amount to £51,947,000, equal to 3.81 per cent. on the total capital sunk, as compared with £51,481,378 in 1915, with a corresponding capital of £1,347,312,000, which gave a net receipt of 3.80 per cent. It may be seen, therefore, from

the foregoing figures that the total amount of capital raised at the close of the year was over £1,349,219,000, of which about £199,569,000, or approximately 16 per cent., was due to nominal additions. These nominal additions formed approximately 19 per cent. of the ordinary stock, 14 per cent. of the guaranteed and preference, and 12 per cent. of the loans and debenture stocks. The total amounts of capital at the end of 1916 compared with 1915 show an increase of about £227,000 in the ordinary, an increase of £874,000 in the guaranteed and preference, and £806,000 in the loans and debenture stocks, making a total increase of £1,907,000. Of the total paid-up capital at the end of 1916, ordinary stock formed 37.0 per cent., preferential and guaranteed 35.9 per cent., and loans and debenture stock 27.1 per cent. The average rate of dividend on the ordinary capital was 3.47 per cent. in 1916, as compared with 3.60 per cent. in 1915. The average rate of dividend on the preferential capital rose from 3.52 per cent. in 1915 to 3.61 per cent. in 1916. These rates are naturally lower than they would have been had there been no nominal additions to the capital of the companies. The average rate of dividend or interest computed on the total capital, as it would have stood if no nominal additions had been made thereto, was 4.13 per cent., as compared with the rate of 3.55 per cent. paid on the total capital including nominal additions.

Gross Earnings of the Railways.—The earnings for the year 1916 amounted to £154,468,000, as compared with £144,860,250 for the year 1915, which gives an increase of £9,607,750, equal to 6.22 per cent.

The passenger amounts for the year 1913 are as follows:—

	1913.	1912.	Inc. or Dec.
1st Class	3,772,000	3,631,676	+140,324

2nd „ ...	88,998	97,435	— 8,437
3rd „ ...	510,679	551,090	— 40,411

The earnings for the conveyance of parcels, mails, and such other traffic as is generally carried by passenger trains amounted in 1913 to £9,836,000, as compared with £10,026,852 in 1912, being a decrease of £190,852, or 1·1 per cent. The total figures of traffic falling under the heading of “goods” are £66,640,000, as compared with £64,048,814 in 1912 an increase of £2,591,126, or 3·9 per cent. The aggregate is made up of £32,990 from merchandise; £31,972,000 from minerals; and £1,678,000 from live stock. The total quantity of goods carried in 1913 was 568,201,000 tons, as compared with 520,279,126 tons in 1912, showing an increase of 47,921,874 tons, or 8·4 per cent.

Expenditure.—The total working expenses of the whole of the railways for the year 1916 amounted to £102,251,000, equal to 66 per cent. of the gross earnings, as compared with a total of £93,378,872 for the year 1915, equal to 64 per cent. The increase compared with 1915 amounts to £9,142,128, or 2 per cent. The total number

of miles travelled by passenger and goods trains during the year 1914 was 430,332,000, or 5,519,000 less than in 1913. The Coal and Coke carried by the various systems of railways from colliery districts in the United Kingdom in 1916 and the previous year (the tonnage represents, as far as possible, original traffic only—i.e., traffic received from collieries or places situated on the companies' own systems):—

	1915. Tons.	1916. Tons.
England & Wales ...	169,603,600	171,299,163
Scotland	31,788,359	32,040,859
Ireland	14,799	25,001

Total U.K.... 201,406,758 203,365,023

Analysing the expenditure, we find the item £18,166,000 for locomotive power; £13,824,000 for repairs and renewals of carriages, &c.; £12,562,000 for maintenance of permanent way, stations, &c.; and £24,180,000 for traffic expenses.

Compensation.—The amount paid for compensation for personal injuries to passengers sustained during the year 1913 amounted to £166,276, and to workmen £298,473. In the movement of goods the companies have paid for damages and losses £740,209, as compared with £573,524 in 1912 an increase of £166,685. We subjoin a statement showing the amounts paid by the principal companies under both heads:

Net Result of Working the Railways.—As regards the actual net earnings of the companies in 1916, the total gross receipts amounted in the year to £154,468,000, and the total working expenditure to £102,251,000. The net receipts, therefore, amounted to £51,947,000, as against £51,481,378 in the previous year. The proportion of net earnings to capital was 3·85 per cent., as compared with 3·55 per cent. in 1915. The amount of paid-up capital increased during the year by about 0·1. The average rates of dividend paid on the ordinary stock fell from 3·66 per cent. in 1915 to 3·47 per cent. in 1916, and in the case of the preferential rose from 3·52 per cent. in 1915 to 3·61 per cent. in 1916, the rates on the other classes of capital remaining substantially unchanged.

The following statement compares the average proportion of net earnings to capital in each quinquennial period from 1871-75 to 1911-15:—

Average of	Years.	Proportion of Total Net Earnings to Capital. Per cent.
1871-75	1871-75	4·56

" 1906-10	1906-10	3·45
" 1911-15	1911-15	3·50

RAILWAY ACCIDENTS DURING 1917.

In 1912 and 1913 the cost per passenger train-mile for personal injury was 0·13d. and 0·14d. respectively. In loss and damage of goods, the cost in 1912 was 0·91d., and in 1913 0·93d. per goods train-mile. The number of personal accidents on railways to passengers, railway servants, and others reported to the Board of Trade during the year 1917 show a total of 899 killed and 4,208 injured (as

compared with 1,066 killed and 5,589 injured in 1916). We will now proceed to investigate under three Tables the various causes from which these accidents arose:—

The following information is given as regards the fatal cases shown in Table I. :—

A. Passengers.—By falling on steps or from platforms, &c., in station limits, 2 were killed, and from other causes 1 was killed.

B. Servants.—While dealing with the loading, unloading, and movement of goods 7 were killed; while attending to engines at rest 12 were killed; by falls on railway premises 12 were killed; while working on the permanent way 7 were killed; and from other causes 7 were killed. Two servants of contractors were also killed by accidents of this nature. One of the fatalities was caused by contact with a live electric wire.

C. Other Persons.—Twenty-four persons other than passengers or servants were killed on railway premises, 10 of whom were killed while on business at stations or sidings. Of these cases 3 were due to persons being crushed between

* Of contractors' servants 7 were killed and 10 injured. In two of the fatal cases the movement of trains, &c., was not concerned.

† Of accidents in which the movement of trains and railway vehicles was not concerned only the fatal cases are shown in the above Table, as during the past two years the railway companies were not required to report the non-fatal cases.

carts, &c.; 3 to the falling of goods, &c., from vehicles; 3 to persons falling off wagons and carts; 2 to persons being knocked down by road wagons; 3 to persons falling off bridges and embankments; 4 to persons coming in contact with electric rails when trespassing on the line; and 6 to other causes.

tractors were killed and 10 injured by accidents of this nature.

The total number of casualties to railway companies' and contractors' servants in connection with the movement of trains, &c., excluding train accidents, was 3,020. It is difficult to assign more than 126 of these to preventable causes.

TABLE II.

The following Table gives the number of casualties in the various classes of train accidents:—

Class of Accident.	A. Passengers.		B. Servants.		C. Other Persons.		Total. All Persons.	
	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.
A. Collision in which passenger trains were concerned	12	233	—	41	—	—	12	274
B. Other collisions	—	1	5	91	—	—	5	92
C. Derailment of passenger trains	—	16	—	—	—	—	—	16
D. Other derailments	—	1	—	10	—	—	—	11
E. Accidents due to failure of engines or rolling stock...	—	—	—	1	—	—	—	1
F. Other accidents	—	9	—	1	—	2	—	12
Total	12	260	5	144	—	2	17	406

III. Accidents caused by the Movement of Trains and Railway Vehicles, exclusive of Train Accidents:—

A. *Passengers.*—By falling when entering or alighting from trains 36 were killed and 650 injured; by falling off platforms and being struck or run over by trains 11 were killed and 4 injured; while crossing the lines at stations 13 were killed and 11 injured; by falling out of carriages during the running of trains 23 were killed and 65 injured; and by other accidents 27 were killed and 120 injured.

B. *Servants.*—While coupling or uncoupling vehicles 6 were killed and 283 injured; by other accidents to persons engaged in shunting operations 67 were killed and 1,113 injured; by falling from trains or when getting on or off trains or railway vehicles 12 were killed and 133 injured; while working on the permanent way, sidings, &c., 59 were killed and 63 injured; by being caught by trains or vehicles while walking, crossing, or standing on the line 126 were killed and 239 injured; and by other accidents 61 were killed and 858 injured. Five servants of con-

C. *Other Persons.*—Of these, 368 were killed and 263 injured; see Table I.

Inquiries.—During the year 1917, 366 inquiries were held by the Assistant Inspecting Officer and Sub-Inspecting Officers of Railways into accidents, other than train accidents, that involved fatal or other injuries to 373 persons, nearly all of whom were servants of the railway companies, the remainder being principally contractors' servants and persons at work or transacting business on the companies' premises. Of this number 342 inquiries related to accidents to 349 servants of railway companies due to the movement of vehicles.

The *Cheap Trains Act, 1883*, provides that fares not exceeding the rate of one penny per mile shall be exempt from duty, but fares for return or periodical tickets shall be exempt from duty only where the ordinary fare for the single journey does not exceed that rate. Duty shall be payable at a reduced rate of 2 per cent. on fares exceeding the rate of one penny a mile between stations within one urban district. Such district will contain not less than one hundred thousand inhabitants, and must be of a

continuous urban as distinguished from a rural or suburban character.

Officers or men in the military or police forces, when travelling on public service, are charged three-fourths or one-half of ordinary passenger rates, according to number travelling. The Act does not extend to Ireland.

Hiring of Special Trains.—Although the

majority of railway companies have no fixed charges for hire of special trains, the general charges are five shillings per mile, plus the ordinary fare for each passenger according to class of vehicle hired.

The Workmen's Compensation Act, 1897.—This Act, which received the Royal assent on August 6, 1897, came into operation on July 1, 1898.

THE RAILWAY CLEARING HOUSE.

This Institution was opened in Jan. 1842, and in addition to the work of clearing through bookings of passenger and luggage traffic, is the medium through which agreements relating to rates and fares, &c., are arrived at. *Chairman*, E. R. Turton, M.P.; *Secretary*, H. Cuff Smart; *Offices*, Seymour Street, N.W.

IRISH RAILWAY CLEARING HOUSE.

The Irish Railway Clearing House occupies much the same position to the railway system of Ireland as the (London) Clearing House does to the railways of Great Britain. It was established July 1, 1848. *Chairman*, Sir William J. Goulding, Bart.; *Secretary*, Joseph Ingram; *Offices*, 5 Kildare Street, Dublin.

Indian Railways.

THE construction of Railways in India commenced in 1853, and the total length open on 31st March, 1916-17, was 36,286 miles. The following are the chief officials of the India Office (Railway Department):—*Secretary*, Mr. H. A. Haines; *Government Director of Indian Railway Companies*, Sir H. P. Burt, K.C.I.E.; *Consulting Engineers*, Messrs. Rendel, Palmer & Tritton. The Administration Reports on Indian Railways formerly published had reference to the working of each calendar year, the last report issued being that for the year 1912. Owing to the adoption, by the principal railway administrations, of the Government financial year for all accounts and statistical purposes, the reports are now published for the Government financial year, which begins on April 1. The number of passengers carried shows that in spite

of a small reduction in the number of trains run, many more millions of Indians travelled last year than before the war. The figures are as follow:—1914-15, 451,085,000; 1915-16, 464,380,900; 1916-17, 486,030,900. The figures for goods carried are: 1914-15, 80,972,000 tons; 1915-16, 82,499,000 tons; 1916-17, 86,242,000 tons. In the same period the coal carried increased from 18 to 22 million tons. Simultaneously the Indian railways have yielded a large increasing surplus to the State. The Indian railways have in their service 626,580 employees, of whom 5,950 are Europeans, 8,400 Anglo-Indians, and 612,230 Indians. The number of servants killed and injured during 1916-17 from all causes was 433 killed and 796 injured; passengers, 247 killed and 824 injured; other persons, 1,500 killed and 482 injured; total, 2,180 killed and 2,102 injured.

In the year 1894 an Act was passed making it legal for Indian Railway Companies to pay interest out of capital during construction, subject to the Secretary of State's specific sanction, and to certain other conditions.

In consequence of the War it has been necessary to omit the statistics and particulars usually included in this Article. Information corrected to June 30, 1916, will be found in WHITAKER'S ALMANACK, 1917 Edition, pp. 847-853.

In the early part of the 18th century numerous inventors propounded schemes for applying steam power to vessels to be run upon rivers and canals. For a chronological list of the first steamboats, pioneer sailings, and earliest steamship lines, see WHITAKER'S ALMANACK, 1913 edition, page 821.

Space being so limited, the evolution of the steamship in the North Atlantic trade is presented in tabular form (page 792).

In 1824 ocean trade was then carried on with sailing ships, mostly under 500 tons each, and all the steamboats in the United Kingdom only numbered 109.

As the size of steamships increased, the heavy cost of construction necessitated the establishment of Corporations, with great strength of

capital, which control the principal ocean routes (see below).

In 1916, 99 owners aggregated 4,432 vessels (19,392,000 tons), which exceeded 38½ per cent. of the entire shipping of the world.

The invaluable Register Book which is published by the Committee of Lloyd's Register of British and Foreign Shipping showed that on June 30, 1916, the steamship empire-builders of Greater Britain owned 10,030 vessels, 20,463,881 gross tons, just over 45 per cent. of the world's steam tonnage.

Owing to recent inventions passengers enjoy greater immunity from accidents, the majority of passenger steamers being now fitted with installation of wireless telegraphy and with submarine signalling apparatus.

EVOLUTION OF THE STEAMSHIP ON THE NORTH ATLANTIC.

(1) Wood Paddle-boats.

(3) Iron Screw Steamers.

(5) Steel Steamships with more than one propeller.

(2) Iron " " "

(4) Steel " " "

Date.	Name of Steamer.	Owners.	Remarks.
1833	Royal William.....(1)	Quebec & Halifax S.N. Co.	From Pictou (N.S.), 1st to cross the Atlantic.
1838	Sirius	British & American S.N. Co.	From Cork, 1st departure from U.K.
"	Great Western	Great Western S.N. Co.	" Bristol, 1st built for Atlantic.
"	Royal William (2)	Transatlantic S.S. Co.	" Liverpool, 1st departure.
1840	Britannia	Cunard Line	" Liverpool, 1st carried British mails.
1849	Atlantic	Collins	" New York, 1st carried U.S. mails.
1856	Borussia	Hamburg-American Line	" Hamburg, 1st
"	Adriatic	Collins Line	Fast sailing of Line. " " "
1858	Bremen	Norddeutscher Lloyd.....	From Bremen to New York.
1856	Persia	Cunard	1st Cunard iron paddle steamer.
1862	Scotia	"	East " " " "
1845	Great Britain	Great Western S.N. Co.	1st Atlantic iron screw steamer.
1850	City of Glasgow	Inman Line	1st to carry steerage passengers.
1858	GREAT EASTERN	East & Australian S.S. Co.	Paddle wheels and propeller.
1868	Italy.....	National Line	1st Atlantic ss. with comp. engines.
1869	City of Brussels	Inman	1st " steam steering gear.
1871	Oceanic (1st)	White Star Line	1st with 'midship saloon, &c.
1874	Britannic	" " "	1st to exceed 5,000 tons, Great Eastern
1875	City of Berlin	Inman	1st with electric light. [excepted.]
1879	Arizona	Guion	Watertight compartments floated her.
1881	Alaska	"	1st "ocean greyhound."
1883	Oregon.....	" (1)	Sunk outside New York; everyone
		" (2)	saved by N.D.-Lloyd ss. Fulda.
1879	Buenos Ayrean	Allan Line	1st Atlantic steel steamer.*
1881	Servia	Cunard	1st Cunard
"	City of Rome.....	Inman (1); Anchor (2)	Fitted with three funnels.
1884	America	National Line	1st and last express ss. of Line.
"	Umbria, Etruria	Cunard	1st with 20 knots speed.
1886	Aller.....	Norddeutscher Lloyd.....	1st triple-expansion express ss.†
1888	City of New York	Inman & International (1)	1st twin-screw ocean expresses.‡
"	City of Paris	American Line (2)	1st to exceed 10,000 tons, G.E. excepted.
1889	Teutonic, Majestic	White Star Line	Designed as mercantile cruisers.
1890	Fürst Bismarck	Hamburg-American Line	1st under 6½ days from Southampton.
1892	La Touraine	Compagnie Générale Trans.	Record Havre to New York, 6¾ days.
1893	Campania	Cunard Line	Lucania; highest day's run, 56½ knots.
"	Lucania	"	Liverpool to New York records.
1895	St. Paul, St. Louis	American	Largest express steamers built in U.S.
1897	Kaiser Wilhelm der Grosse	Norddeutscher Lloyd.....	Record day's run, 580 knots. [tons.]
1899	Oceanic	White Star Line	Balanced engines; 1st to exceed 15,000
1900	Deutschland	Hamburg-American Line	Fastest ocean steamer to date.
1901	Celtic	White Star Line	1st to exceed 20,000 tons.
1903	Kaiser Wilhelm II.	Norddeutscher Lloyd.....	Largest express steamer to date.
1904	Victorian	Allan Line	1st fitted with turbine engines.
1907	Lusitania, Mauretania.....	Cunard Line	Fitted with turbine engines.
1908	Laurentic	White Star Line	14,892 tons, reciprocating engines with a low-pressure turbine.
1910	Olympic	" " "	46,359 tons.
1913	Imperator	Hamburg-American Line	51,969 tons.
1914	Aquitania	Cunard Line	45,647 tons.
"	Vaterland	Hamburg-American Line	54,282 tons.

* Union Co. of N.Z.'s Rotomahana, 1,763 tons, was first ocean steel ss., 1879.

† Martello, 2,432 tons, of Wilson Line, was first Atlantic cargo triple-expansion ss., 1884.

‡ Notting Hill, 3,921 tons, of Twin-Screw Cargo Line, came out so engineered, 1881.

§ Mauretania largest and fastest to date. Record day's run 676 knots, 25 January, 1911.

PHOTOGRAPHY AS THE EYES OF THE ARMY.

By H. WHITWORTH HALL.

WITH the advent of flying a new factor was introduced into warfare and the element of surprise which played so important a part in the battles of the past became largely eliminated.

Had Napoleon at Waterloo possessed an aeroplane he would have been spared the tragic surprise of the hidden road of Ohain, which cost him the flower of his cavalry, and the whole future of the world's history might have been changed. At Waterloo one aeroplane would have sufficed, but so immense is the scale on which modern battles are fought that their limits pass far beyond the vision of any single observer, and to survey the whole front a legion of aeroplanes is needed.

The results obtained from observations must be unified before they can be of value to the high command, and with every increase in the number of observers it becomes more and more necessary to eliminate the human element with its liability to error.

It is here that photography enters upon its new role as the eyes of the modern army. A photograph taken in the thousandth part of a second will convey more information than the most painstaking observer could gather in half-an-hour, and hundreds of such photographs can be so combined as to form a complete and wonderfully detailed map of a whole front.

Photographic reconnaissance is no mere affair of dash and daring. It is a matter of steady, continuous and dangerous work, according to plan.

Photography alone renders it possible for the high command to keep in touch with the ever-changing details of a battle front hundreds of miles long. The general of to-day no longer surveys the field amid the smoke of battle, mounted on his charger and surrounded by his staff. Alas for the artist of the future—he will have to picture Field-Marshal Haig studying a big mosaic of photographs.

Deprived of the aid of photography for a week, the Allied Armies would be handicapped to a perilous extent. Their position would resemble that of blind boxers striking vainly in the dark and exposed all the time to the blows of their unseen opponents.

At the beginning of the war photography was regarded as a luxury trade menaced by extinction. What lingering hope might have remained was shattered by the fact that much of the raw material needed for the manufacture of sensitive plates and papers came from countries rendered commercially inaccessible by the war. The energy and resource of British manufacturers, however, proved equal to the occasion, the difficulties in the direction of raw material having been surmounted so

successfully that the country will never again be dependent on the old sources of supply. As far as the Wellington factories are concerned, the problem has been so satisfactorily solved that they have never been at a loss in meeting the requirements of the British and allied governments. There are few things in the history of the firm which give so much cause for pride as the fact that, in the face of countless difficulties in the matter of staff and material, they have during the war been successful in evolving a sensitive paper especially suited to the needs of the Air Service.

The allied cause is equally indebted to photography for its service in the field of propaganda. The camera has enabled neutral and allied countries to see for themselves the devastation and ruin worked by the German armies, and it has also presented in graphic form the immensity of the allied resources and the changes wrought by the war in the life of the nations. In countless directions it has effectively countered the insidious efforts of enemy agents. The wonderful exhibitions organised by the Ministry of Information have given a vivid idea of the important part played by photography.

The services rendered by professional photographers during the past four years may be fairly said to form a notable chapter in the story of war work. It is they who have provided the relatives of our soldiers with precious souvenirs of our honoured dead; while the photographs from "Blighty," with their memories of home and loved ones, serve as a constant solace to the men in the trenches and are counted as their most treasured possessions.

The development of industrial efficiency is being facilitated by the aid of photography, which, owing to the huge increase of production and the growth of standardisation, is taking a more and more important role. Almost every large factory is now equipped with its photographic department, which deals with problems as wide apart as the photo-micrographic examination of metals and the elimination of waste movement on the part of factory operatives. Photo-micrography, it may be explained, combines the function of the microscope with that of the camera, and the highly-magnified photographs showing the structure of metals are often the means of detecting faults which would otherwise escape notice until perhaps some serious accident brought them to light. Although useful work has already been accomplished, it is safe to say that technical photography is still in its infancy and that future developments will far surpass present-day achievements.

ASBESTOS.

ASBESTOS is one of the most marvellous products of inorganic nature, and is a paradoxical link between the mineral and vegetable kingdoms, with characteristics of both, yet altogether different from either. It is found as a hard, heavy rock, and when treated yields fibre as soft as silk and as light as a feather.

The Greeks called this remarkable material *Asbestos*, indestructible, and *amianthus*, unde-fled, from its resistance to decay under any condition of time, heat or moisture.

Asbestos is found all over the world. It occurs in some parts of England, Scotland and Ireland, but not in quantities that would pay for its working. The principal sources of supply are within the British Empire, Canada producing the greatest quantity, followed by South Africa and Siberia.

Asbestos is composed mainly of a silicate of magnesia with a little alumina, and contains varying quantities of iron oxide. The best fibres are long, flexible and white.

One of the first recorded uses of Asbestos was for wicks for the lamps which provided the sacred fires in the temples of the Gods in ancient Greece. The natives of Siberia were using a cloth made from asbestos about 800 years ago, and the principle underlying the process of working up asbestos from the native rock is much the same to-day as was described by Marco Polo in the thirteenth century. They broke up the asbestos rock found in the native serpentine formations and beat it in a mortar to release the fibres from their earthy base. After repeated heating, blowing and sifting, the fibres were spun and then woven in a rough loom into cloth. By modern methods the raw material is first blasted out and the broken rock carefully hand-sorted, and transported to the mills, where it is cobbled, run through crushers, and graded according to the length and quality of the fibre. The raw asbestos is crushed and pulverised, after which the material is dried in heated cylinders. It is then re-crushed, screened and fibrised in cyclone mills. The fibre is now ready for the carding engine, which straightens the fibres and places them parallel. It is finally passed through a finisher or condenser, which removes waste material. It is then ready for spinning.

The demand for the raw material is enormous. Prior to the war, the Germans and Austrians made very strenuous efforts to secure not only the British market but also the markets of the Empire and other countries, but, due to the enterprise and courageous efforts made by the principal British manufacturers, their efforts were frustrated, in spite of the fact that the enemy industry was heavily subsidised.

It is very interesting to record that the war

has brought about very considerable developments, and asbestos has been found valuable in ways hitherto unthought of, and in all cases the home firms have risen to the occasion.

Much superior goods are now being made than were ever exported to this country by the foreign firms, and at reasonably low prices having regard to the enormously increased cost of production due to the difficulty of obtaining supplies of raw materials, increased freights, etc.

The Asbestos Industry has a great future before it. Electrical engineers and manufacturers of all classes of steam and electric machinery, shipbuilders, armament makers and many others find asbestos absolutely indispensable. To give a tithe of the manufactures would require a long article to do full justice.

The engineer and electrician find many uses for asbestos in their manufactures, the former calling for steam-engine packings and jointings, in the manufacture of which asbestos is pre-eminent owing to its heat-resisting properties. The electrician calls asbestos into use as the only fireproof textile insulator for his various electrical appliances. Asbestos millboard is largely used as an insulator in buildings and as a lining for retorts, gas stoves, etc. In steam-pipe insulation asbestos plays an important part in the prevention of radiation of heat, and the consequent saving of fuel amounts to a large percentage.

In the form of a specially woven cloth and prepared fibre, asbestos is largely used as a filtering medium in breweries, chemical works, etc., and in the treatment of sewage.

Asbestos finds a wide use in the laboratory in the filtration of acids and other liquids. Fire-proof curtains are compulsory in theatres. Asbestos paint is extensively used.

From Asbestos combined with the finest quality British Portland Cement, asbestos-cement building sheets and slates are produced. The scientific combination of these materials gives a product of great strength, fireproof, waterproof, and indestructible, and which is extensively used in the erection of factories and workshops of all descriptions, bungalows, schools, barracks, garages, hangars, military huts, hospital and staff quarters, and is invaluable for lining walls, forming ceilings, or partitions.

In the form of large ribbed roofing tiles or sheets, it is rapidly replacing galvanised corrugated iron in the hands of structural engineers, because it does not decay and is of better appearance.

To-day Asbestos is indispensable in a hundred British industries, and in one form or another is found in use throughout the civilised world.

MARINE INSURANCE.

TOWARDS the latter part of the Seventeenth Century, the Commercial Community interested in Shipping met at a small Coffee-House kept by a man of the name of Edward Lloyd, first of all in Tower Street and, after 1691, at the corner of Abchurch Lane and Lombard Street, in the City of London. The name of this Coffee-House keeper has come down from generation to generation in connection with the greatest Shipping and Marine Insurance transactions of the World.

Before his time Marine Insurance appears to have been conducted in England by the Lombards, who came from Italy and gave their name to Lombard Street, but from the time that Lloyd established his Coffee-House, where Seafaring men jostled against Merchants, Britons conducted Marine Insurance in England.

There is still preserved at Lloyd's a Policy of Marine Insurance dated January 20th, 1680, upon the Good Ship called the "Golden Fleece," of 250 Tons (Gasper Hicks, Master), for a voyage from Lisbon to Venice, at the rate of Four Pounds per cent.

Edward Lloyd, a man of wisdom and enterprise, was the founder of that great system of Commercial and Maritime Intelligence which has ever since been carried on by Lloyd's.

In 1696 he started a Newspaper, which gave a List of Ships whose arrivals and sailings had been reported. That Newspaper, which he called "Lloyd's List," succeeded admirably for a short time, but criticism was not much tolerated in those days, and Edward Lloyd ventured to write an Article which called in question the action of the House of Lords with regard to Silks. The House of Lords apparently resented this; they immediately censured Edward Lloyd, and suppressed his Newspaper, and it was not till 30 years later that he was allowed to re-establish it. Since that date "Lloyd's List" has appeared regularly, and is still printed and published as a daily Shipping and Commercial Newspaper at Lloyd's, Royal Exchange, in the City of London.

The frequenters of Lloyd's Coffee-House were not permitted to enjoy for long the monopoly of Marine Insurance, and in the year 1720 Parliament allowed two Marine Insurance Companies to be established in London. These Companies, The Royal Exchange Assurance Corporation and the London Assurance Corporation, are continuing business at the present day.

In the year 1770 those frequenters of Lloyd's Coffee-House whose particular business was Marine Insurance, formed themselves into an alliance, and moved to Pope's Head Alley, taking with them "Lloyd's List." In 1774 they removed to the Royal Exchange, where the Corporation of Lloyd's is still established, and in the same year the Underwriters of Lloyd's found it necessary to have complete information with regard to the construction and condition of the Ships which they insured, and they accordingly established a Register of Shipping. This undertaking grew and prospered, and is still carried on by "Lloyd's Register of Shipping" at 71, Fenchurch Street, E.C. 3.

In 1803 the Members of Lloyd's started a Fund for the benefit of sufferers by the War between this Country and Napoleon. This Fund, called "Lloyd's Patriotic Fund," eventually reached a sum of over £883,000, and has rendered much help to the relatives of Sailors and Soldiers who have fought in our Wars from 1803 down to the present day. In 1915 the Members of Lloyd's subscribed over £115,000 for a similar object in connection with the present Great War, and this sum is administered by the Committee of Lloyd's Patriotic Fund.

Other funds raised at Lloyd's in connection with the Great War are Lloyd's French Ambulance Fund, £38,533; King George's Fund for Sailors, £16,044; Lord Kitchener National Memorial Fund, £12,244; St. Dunstan's Blinded Soldiers' and Sailors' Hostel, £9,969; the Mine Sweepers' Fund, £6,913; the Y.M.C.A. Canteen and Hut Fund, £46,859; and British and Allied Red Cross Societies, £101,379, besides substantial contributions to many other War Funds.

In the year 1810 a select Parliamentary Committee was appointed to enquire into the monopoly of Marine Insurance, which was held by Lloyd's and the two Marine Insurance Companies referred to above. The Committee recommended

that the monopoly should be abolished, but the House of Commons decided that Lloyd's had rendered a great service to the Country, through the long years of War with France by supplying the Government with information in regard to maritime matters and, together with the Marine Insurance Companies, by insuring the arrival in this Country of Merchant Ships and their valuable cargoes. The House, therefore, resolved that no alteration should be made, but ten years later, in 1820, an Act was passed by which Marine Insurance in this Country was thrown open, and since that date many other Marine Insurance Companies have been established, and these Companies together with Lloyd's form the Marine Insurance Market of London.

The Marine Insurance Companies, although competitors with the Underwriters at Lloyd's for Insurance business, are yet supporters of the Corporation of Lloyd's and its system of collecting Maritime Intelligence from and diffusing it to all parts of the World.

The Royal Exchange was destroyed by fire on the 10th January, 1838, and by this unfortunate circumstance most of the important records of Lloyd's were lost. It was to the Rooms at present occupied by Lloyd's that Queen Victoria came when she opened the new Royal Exchange in 1844.

Lloyd's was incorporated in 1871 under Lloyd's Act of that year, having previously existed for about 200 years as an unincorporated Society of Underwriters, which had since 1811 been regulated by a Deed of Association and by rules from time to time made under that Deed.

This Act was amended by Lloyd's Act, 1911, under which the objects of the Society were extended to meet the requirements of modern developments.

The Committee of Lloyd's, as a body, is only interested in the Insurance Business carried on at Lloyd's to the same extent that the Committee of the Stock Exchange is interested in the Business carried on by its Members, namely, the laying down of regulations to safeguard the interests of Members as well as those of Policy holders.

The work of Lloyd's, as a Corporation, is to protect the interests of Members of the Society in respect of Shipping, Cargoes, Freights and other Insurance business, and for this purpose it is necessary to obtain early information of the movements of British and Foreign Mercantile Shipping and to be in touch with every Port in the World.

The Corporation of Lloyd's has therefore established Signal Stations and Wireless Stations at many important points on the Coasts of the United Kingdom and Abroad, and there is a Lloyd's Agent, or Sub-Agent, at every Port in the World.

Lloyd's Signal and Wireless Stations have proved themselves very valuable not only to Underwriters but also to Shipowners and Merchants, as, besides getting news of a vessel, it is frequently necessary that she should be intercepted off the Coast, either in Home or in distant Waters, and ordered to a new destination.

Marine Insurance business has always been the principal business at Lloyd's, but for some years past a very considerable Insurance business for War Risks, Fire, Aircraft, Accident, Employers' Liability, Jewellery, Motor Cars, Burglary, etc., etc., has been transacted by Members of Lloyd's.

All Underwriting Members of Lloyd's deposit with the Committee of Lloyd's Securities and Guarantees in proportion to the amount of business that they transact, and all Underwriters' accounts are audited annually by approved Auditors, who report the result of these Audits to the Committee of Lloyd's. In addition to this, the personal Liability of all Underwriters is unlimited, and the security of a Lloyd's Policy is, therefore, fully safeguarded.

To effect an Insurance at Lloyd's, it is necessary to employ the services of an Insurance Broker, who must be either a Member of, or a Subscriber to, Lloyd's.

LLOYD'S,

ROYAL EXCHANGE, LONDON, E.C. 3.

Members of Lloyd's do not advertise, but a list of Lloyd's Insurance Brokers, with their addresses, will be forwarded on application to the Secretary of Lloyd's, Royal Exchange, London, E.C. 3.

BRITISH SHIPBUILDING.

By JOSEPH L. CAROZZI, Editor of "Syren and Shipping."

NOTWITHSTANDING America's abnormally increased activity, the United Kingdom is still the world's greatest shipbuilding centre. Taking naval as well as mercantile tonnage into account, the productive capacity of the British industry has never been greater than it is to-day; with a war in progress it is not permissible to be more precise. What the post-war power to produce ships of every type will be may be assumed, however, from the facts (1) that in the latest complete year before the outbreak of hostilities something like 2,264,000 tons of mercantile and war shipping was launched; (2) that since then important extensions of plants have been made and several new yards have been established.

Excluding vessels of 100 tons gross and under, the merchant ship proportion of the 1913 total was 1,932,153 tons gross. The aggregate for the rest of the world, including British Dominions, comparable with the 2,264,000 tons, was, in round figures, 2,000,000 tons. Two firms launched between 90,000 and 100,000 tons, four firms between 80,000 and 90,000, three firms between 60,000 and 80,000, nine firms between 40,000 and 60,000, and twenty-one firms between 20,000 and 40,000.

Leaving Admiralty establishments out of account, but including yacht and boat yards, there were about 160 shipbuilding yards in the United Kingdom in pre-war days—67 in Scotland (chiefly on the Clyde), 40 on the N.E. coast, 48 elsewhere on the English coast, and 5 in Ireland. The work done in them under normal conditions was extremely varied, and included battleships, battle cruisers, light cruisers, destroyers, submarines, fleet auxiliaries, ocean liners, passenger and cargo steamers, cargo steamers, channel packets, coasters, paddle steamers, stern-wheel steamers, bulk-oil-carriers, meat-carrying steamers, dredgers, hopper barges, yachts, motor-boats, train-ferries, ice-breakers, and floating docks.

British builders produced more quickly and at less cost than the most successful of their rivals, and the effect of that was visible in the contracts they executed for foreign Governments and shipowners. No industry produced so many warships (including Dreadnoughts) for foreign Governments as they did. In the five years, 1910-14, their mercantile work for abroad averaged 22½ per cent of the total output of merchant ships.

During the past thirty years foreign countries have done an increasing proportion of the world's total shipbuilding. The British industry has, nevertheless, steadily increased its output. In 1892 it launched 631 merchant vessels of 1,109,960 tons gross; in 1902 694 vessels of 1,427,558 tons gross; and in 1913 638 vessels of 1,932,153 tons gross. Ships of every type have grown bigger,

and their speed has appreciably increased. Accommodation for passengers has been vastly improved, and vessels of every kind have become safer so far as ordinary marine risks are concerned.

The United Kingdom has never lost the lead it took at the start in steel shipbuilding. Harland & Wolff, Belfast, pioneered the construction of leviathan liners. Their *Oceanic*, for the White Star Line, was the first vessel to exceed the length of the *Great Eastern*. The original Atlantic greyhound—the Guion liner *Alaska*—was built on the Clyde; and the speediest vessel in the New York pre-war service—the Cunarder *Mauretania*—on the Tyne. In respect of the comfort and elegance of their accommodation British-built liners challenge comparison with the best produced anywhere.

All the earliest successful applications of the steam turbine to the propulsion of ships were made in the United Kingdom, which continues to lead the world in the development of the system. Practically all the important developments of Naval Architecture are to the credit of Great Britain. The world's largest bulk-oil-carrying vessels have been built in the United Kingdom—principally on the N.E. coast. The steamer with cold-storage accommodation for the transport of perishable cargoes has been highly developed by British builders. Several vessels of this type are capable of carrying roughly 5,000,000 lbs. of meat.

The first cost and working expenses of the pre-war British cargo steamer were exceptionally low. With vessels of the type British owners captured the world's carrying trade. Since the industry came under the control of the State the further development of the idea has necessarily come practically to a standstill. But with a practical shipbuilder like Lord Pirrie as Controller General the effect of the check is unlikely to be lasting. Instead of building cargo vessels to the designs of shipbuilders or shipowners, we are now embodying about a dozen standard designs. We are also increasing our productive capacity by "fabricating" the parts of standard ships in bridge works and non-marine engine shops and "assembling" them in suitably equipped yards situated conveniently to launching water. As the "fabricated" ships have not a curved frame in them, the machinery available in the bridge yards is quite capable of dealing with the parts.

In order to get over the difficulty created by the war period's heavy demand for steel, a considerable number of barges and tugs are being built of reinforced concrete. It does not seem to be doubtful that with his varied war period experience added to that of his earlier strenuous days the British shipbuilder will, sooner or later, find his way back to his old pre-eminence.

BRITISH SHIPOWNING.

By the Editor of "The Shipping World."

TO the British shipowner 1918 was a year of great anxiety in the conduct of his business. The transition from the driving force of individual enterprise to the trammels of State control which the War has forced upon him has not been easy; and those who imagine that the shipowner's worries have been sensibly lessened by the State assuming responsibility for the shipping industry fail to understand the real difficulties of his position. It is true the shipowner is now little better than an agent of the State, running his business at the dictates of the Shipping Controller, paid out-of-pocket and management expenses, not on results (as he should be), but on time. Hence all incentive save that of serving his country to the best of his ability has been taken away from him; he is hampered at every turn by paralysing regulations, to which he must conform whether he believes in them or not; while all the time he cannot but realise how much more efficiently and economically he could manage his fleet if left entirely to his own resources, and how war conditions are making a present of his business to his oversea competitors. Only a strong sense of patriotic duty keeps him silent and continuously employed; only his well-founded belief in the fair dealing of the Shipping Controller makes him tolerate present conditions as temporary evils from which he hopes to escape as soon after the War as possible. In fairness it should be said that Sir Joseph Maclay, the Controller, has shown extraordinary tact in negotiations with his fellow shipowners, and business shrewdness in calling upon them to assist him in his gigantic task of operating the entire sea-going merchant tonnage of the British Isles as a national cargo-carrying service. But although in the fifth year of war British shipowning cannot any longer be considered a private concern, the private owner as a business man must still maintain an interest in his property and its future. The outlook, indeed, gives him some cause for anxiety, which finds an index in the fluctuations in shipping share values throughout the past twelve months. Blue Book rates of freight, on which the British shipowner is paid, were revised in his favour during the year, but this concession came somewhat late in the day, and even now the terms are not too generous. It is certain that the number of British shipping companies which will pay Excess Profits Tax on the past year's working results will be less than before; and Lord Inchcape's prediction at the Chamber of Shipping that less prosperous times lie ahead for their business is generally accepted by shipowners.

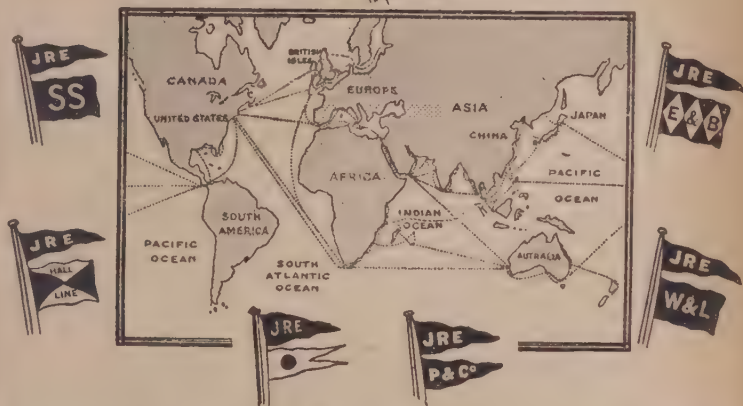

At the beginning of the year the principal concern of the shipowner was the continuous

and cumulative inroads made on British tonnage by enemy action and marine loss. Since then the position has distinctly improved; there have been fewer sinkings and a larger shipbuilding output. In this sense Lord Jellicoe's prophecy that by August the enemy's submarine menace to our sea communications would be defeated has been verified. The construction of new tonnage in the shipyards of the world now exceeds, month by month, the tonnage lost, although the margin between gain and loss is still slender enough. There is a big leeway to make up. The total British ocean-going mercantile steam tonnage at the outbreak of war was, in round figures, 18,500,000 tons gross, while the corresponding figure to-day is only 15,000,000 tons gross. And until last autumn at least the disappointing feature of the losses and their replacement by new construction was that British ships were being sunk or put out of commission at a faster rate than they were being increased by new building in British yards or to British account abroad. It follows that while the danger point in the total of the world's shipping has been passed, the proportion of ships flying the British flag on the high seas has shrunk in relation to the sum of the world's tonnage now afloat. British ships still carry about half of the world's goods at sea, still sail in the danger zones in preponderating numbers, but for these very reasons they are most subject to attack, suffer the most severe casualties, and consequently require, if the British mercantile marine is to come out of the War with its ascendancy unimpaired, the most strenuous shipbuilding efforts to counteract the wastage.

These considerations, as the end of the War draws steadily nearer, naturally engage the minds of British shipowners. What will be their position when peace is declared? Will their fleets be able to meet, on anything like equal terms, the competition of the world, of neutral maritime nations suddenly grown rich through the necessities of the belligerents, with enlarged fleets in good running order and with big reserves behind them, or of such an ally as the United States? Fortunately Mr. Hurley, Chairman of the United States Shipping Board, states that the new American ships "shall be operated after the War upon principles which recognise human and national rights and equities"; and, in any case, we may be sure that the world's shipping trade, when finally left to economic laws of supply and demand, will gravitate into the hands of those nations which can guarantee full cargoes of necessities on both outward and homeward voyages. This we can do with coal and food in bulk in the trying period of after-war reconstruction. As for Germany we believe she is already out of the running at sea.

ELLERMAN LINES LIMITED

Controlled by Sir John R. Ellerman, Bart.

THE carrying capacity of the Steamers serving the numerous "Ellerman" berths throughout the world at present approaches 1,000,000 tons deadweight, and additional steamers, with an approximate capacity of 200,000 tons, are in course of construction. Powerful and Luxurious Passenger Steamers to suit the various trades are a special feature.

The following are the principal Lines (known collectively as the Ellerman Lines Ltd.) and their trade routes:—

BRITISH MARINE ENGINEERING.

By the Editor of "Syren and Shipping."

WHEN the details of the United Kingdom's industrial activities during the great war are available, it will be found that Marine Engineering excelled itself. Its output, measured in horse-power, was enormous, and it comprised steam turbines for speedy surface warships, Diesel oil motors for submarines, and reciprocating steam engines for merchant ships. Some of the turbine units were exceptionally powerful, and in respect of both design and construction they were the most advanced things of their kind the world had ever seen. A multitude of boilers, cylindrical and water-tube, were produced, and in addition there was an immense output of auxiliary machinery.

British engineers were prominent very early in the development of steam navigation. The *Comet*, Europe's first successful passenger steamer, was Clyde built, and from her time forward British marine engineers have led the world. By the steady increase of steam pressures, the adoption of surface condensation, and the compounding, tripling and quadrupling of expansions, they carried the reciprocating engine to a high pitch of efficiency.

The first warship, and the first merchant ship—the Clyde steamer *King Edward*—to be direct-driven by Parsons turbines were British built; so were the first merchant ship—the New Zealand Company's *Otaki*—to be fitted with reciprocating engines exhausting into low-pressure turbines, and the first merchant vessel—the Newcastle cargo boat *Vespasian*—to be driven by geared turbines. The only other embodiment of the turbine idea which has been applied to the propulsion of large vessels is the Curtis—an American arrangement which, in its British form, is known as the Brown-Curtis.

Ljungstrom turbines, associated with an electric transmission system, have been installed in two smaller vessels. Under the pressure of the war period's necessities, our development of the geared turbine has been carried far. No other people knows as much about the system as we do. Three transmissions have been tried to date. In one, the turbines generate electricity which is transmitted to motors on the propeller shafts. In another, they drive a centrifugal pump arrangement which in its turn drives water turbines on the propeller shafts. In the third, mechanical reduction gears are employed. The last named is far and away the most popular, and an efficiency of 98½ per cent. is claimed for it.

British marine engines of every type have always been notable for their economy, in the

promotion of which auxiliary machinery has played a very large part. British auxiliaries are acknowledged to be the best in the world. No technical interest has played a more prominent part in the development of the marine steam engine than the British Admiralty. The blue ribbon of the Atlantic has generally belonged to a British vessel. At the moment, the holder is a Tyne ship—the Cunarder *Mauretania*. The speediest cross-Channel packet has been, as a rule, British. The Newhaven-Dieppe liner—*Paris*—was built at Dumbarton. Some notably fast paddle boats are to the credit of the Clyde.

With the industry just emerging from an exceptionally close control, the position of the marine internal combustion engine is necessarily obscure. The Diesel motor is a Continental idea, and chiefly in its four-cycle form has made considerable headway there. Thanks to the enterprise of Lord Pirrie, a British company is making the most successful of the Continent's four-cycle engines—the Burmeister and Wain. A British firm—Messrs. Doxford, Sunderland—have evolved a two-cycle engine of their own. Another—Messrs. Cammell Laird, Birkenhead—have adapted the Fullagar to marine propulsion.

A number of other British concerns are licensees of Continental makers. On the whole, there does not seem to be any reason to be despondent about Great Britain's Diesel prospects; more engines of the type are, in fact, in progress than there have ever been. Most of the United Kingdom's surface-ignition engines are small. For craft like auxiliary yachts, fishing vessels, ships' lifeboats, naval pinnaces and launches, British-made paraffin engines are preferred to almost any other. They also figure, very nearly exclusively, as prime movers in the emergency lighting and wireless sets of ocean-going passenger ships.

Steamers which burn oil instead of coal are naturally less numerous in general trade than they are in trades running conveniently to liquid fuel sources or supply stations. There are, however, several highly efficient British oil-burning systems. Many warships are oil-burners, and a considerable number use it on occasion in conjunction with coal. Just before the outbreak of war, one or two important British shipping companies were preparing to convert a selection of their coal burning steamers to oil burning.

Including shipbuilders who are also makers of propelling machinery, there are about 100 marine engineering firms in the United Kingdom, nearly half of which are in Scotland. In 1913, the last complete pre-war year, their combined output was about 2,680,000 horse-power. Two firms had each over 200,000 horse-power to their credit, one between 150,000 and 200,000 horse-power, three between 100,000 and 150,000 horse-power, and thirteen between 50,000 and 100,000 horse-power. Since the outbreak of war, a considerable number of other firms have been turned on to the construction of marine engines. The actual productive capacity of the industry is, therefore, much greater than these figures indicate.

SHIP REPAIRING.

THE United Kingdom's provision for the overhaul and repair of merchant ships and marine engines is greater than that of any other maritime country. Its large scale is, however, less due to our pre-eminence in shipbuilding than it is to our immense and wide-spread shipping activities. Being, with the conditions normal, the world's foremost owner of ships, we are naturally also its leading ship repairers. A number of shipbuilding firms on the North-East coast, the Clyde, the Mersey, and at Belfast and Southampton are repairers in a big way; but that the construction of new, and the maintenance of existing, vessels may be profitably run as separate businesses, seems to be proved by the facts (1) that many firms are ship repairers exclusively; (2) that the Bristol Channel—probably our most considerable centre of the repair industry—is not, leaving Bristol and the national yards out of account, a builder of ships at all. The Thames, which now does practically no shipbuilding, is also a large repairing river.

For reasons which are not obscure it would be indiscreet at the moment to go deeply into the details of the business—especially to indicate what the dry docking accommodation at the principal ports is. From the figures given further on readers ought, however, to have little difficulty in realising the extent of the industry's operations. The very largest liners can be taken in hand and extensively treated on the Mersey, and at Southampton and Belfast. The range of work which is within the capacity of the Clyde is very nearly as great. The Port of London's repair activities are generally heavy and the variety of its operations considerable. The bulk of the cargo-boat work for home and foreign owners is done by the Bristol Channel, and the Tyne, the Wear, the Tees, the Hartlepoons and the Humber. South Wales ports are especially well equipped. One of the largest proprietary of Dry Docks have, for instance, large establishments in four of them, and the docking accommodation at their disposal is sufficient for twenty vessels at the same time.

Extensive provision for the dismantling, wintering, fitting out, repairing and overhauling of yachts, of all sizes and types, is to be found on the Clyde's lower reaches, the Itchen at Southampton, the Gosport side of Portsmouth Harbour, at West and East Cowes, and in some West of England Ports. During the war very little work of this character has been done; but before the outbreak of hostilities there was a great deal of it to do, and when they come to an end its importance and value are unlikely to

be diminished. Practically every port in the Kingdom, however, has its ship or yacht repairing industry, whose importance and scope correspond, as a rule, to local shipping requirements and are in several instances ahead of them.

It goes almost without saying that the British ship repairing industry's efficiency is high; the amount of work which it does normally for foreign interests is convincing proof of that. Moreover, many wonderful restorations of badly damaged vessels are to its credit. The accounts of some of these achievements read like romance, and their plain significance is that no ship which can be salvaged and taken to a British port is irreparable.

With the outbreak of war, the calls upon our repairing and overhauling resources naturally became abnormally heavy; but with re-organisation on a national scale our resources have proved wonderfully adequate. It is much less easy to give an idea of the work of the repair yards than it is to express the activities of shipbuilding and engineering, whose output over a period can be given in terms of gross tons or indicated horse-power. But it is not impossible to express it. According to figures passed for publication by the Censor, United Kingdom yards repaired and restored to service 5,307 vessels of 16,150,000 tons gross between August 3rd, 1917, and April 25th, 1918. That gives a weekly average for the whole period of 414,105 tons gross. But, as a matter of fact, the average for several weeks in the early part of 1918 was 500,000 tons gross, and was steadily increasing. As much as 2,120,301 tons gross has been in hand in one week and during that week half a million tons was restored to service. The greatest amount of shipping restored in a single week in the period under review was 598,000 tons gross.

An industry capable of operating on such a scale is obviously an important national commercial asset as well as a highly valuable auxiliary to the Navy. With its war period experience to draw upon, its efficiency should be more pronounced than ever when the conditions again become normal. A free industry necessarily calls for different conditions than those which are applicable to a controlled industry. But it is extremely unlikely that the great centralisation lesson of the war period organisation will be altogether lost on the private industry. At present there is such a refinement of organisation that an official, sitting at a desk with a chart and the key to it before him, can tell in a few minutes the condition of every berth in the Kingdom.

OIL TANKERS.

By ROBERT MACINTYRE.

FOR reasons which are not obscure very little can be written about the war period's construction of oil-carrying vessels. But before the outbreak of hostilities a great fleet of tankers was in commission, supplying the world's heavy normal demand for petroleum and petroleum products. In May, 1915, there were about 434 ocean-going steamers of the type, representing 1,637,000 tons gross, as well as 57 sailing ships of 99,788 tons gross.

The modern tanker dates from about 1886, the oil having previously been transported in barrel or tins. The *Atlantic*, an iron sailing vessel, was built on the Tyne in 1863 to carry oil in bulk, and the *Vaterland*, a steamer of 2,748 tons gross, in 1872. The first vessel to load a bulk cargo of oil in America for Europe was the Norwegian steamer *Stat*, which sailed from Philadelphia for Rouen in 1879. The pioneer vessels of the type, as we know it to-day, were the Tyne-built steamer *Gluckahf*, of 2,307 tons gross, and the Swedish-built *Sriet*. They were built in 1885 or 1886.

The *Bakuin*, launched a little later at West Hartlepool, was the first British-owned tanker. These vessels were naturally immature embodiments of the idea of carrying oil in holds which are themselves really oil-tight tanks; but that the principle was sound is abundantly proved by the course which the evolution of the type has taken. Mr. Herbert Barringer has admirably enumerated the different stages of the tanker's progress as follows:—(1) The introduction of longitudinal and transverse bulkheads, (2) the fitting of expansion trunks, (3) the provision of coffer-dams forward and aft of the cargo tanks, (4) the carriage of oil direct to the skin of the vessel without the use of independent tanks, (5) the abolition of the cellular double-bottom below the cargo tanks, (6) the building of pump rooms extending the whole breadth of the vessel and carried down to the bottom plating of the ship and up to the upper deck, (7) the fitting of compound hatches in order to deal with the carriage of other than liquid cargoes, (8) the elaboration and improvement of pumping arrangements, (9) the fitting of mechanical ventilation to tanks, (10) the introduction of liquid fuel in place of coal for steam raising.

Nearly all the large tankers built in the United Kingdom and the United States are constructed with longitudinal frames on the Isherwood system. Some of the vessels have their propelling machinery aft, and some, in the ordinary way, amidships. The oil-carrying capacity of

the bigger vessels is impressive. In pre-war days, the Anglo-American Oil Company's Belfast-built steamer *Iroquois* and barge *Nacahoe*—the steamer towed the barge—carried 18,000 tons of oil between them. The Eagle Oil Transport Company's *San Jeronimo* and *San Nazario*—both of which were built by a well-known firm of old-established shipbuilders on the N.E. coast—were said at the time they were launched to have a deadweight capacity of 15,500 tons each.

Other types of bulk-oil-carrying vessels have, of course, been built on both sides of the Atlantic. An American vessel has been fitted with cylindrical tanks placed horizontally in the holds; the tanks are removable, the idea being to use the ship for carrying either oil or ordinary cargo. Vessels fitted with cylindrical tanks have also been built in the United Kingdom. In their case, the tanks stand vertically, and their diameter is nearly the same as the beam of the vessel where they are fitted. To meet the war's demand for more tanker tonnage Lloyd's Register have given classification to ordinary cargo vessels in which the oil is carried in similar tanks.

Considering petroleum's high value in war the necessity of storing it in such a way as to render it safe from attack by naval guns or aircraft bombs is obvious. A well-known Wear-side firm have designed a barge storage tank, 150 ft. long by 30 ft. in diameter, with a capacity for 2,400 tons of liquid fuel. It has hemispherical ends, and is sub-divided by bulkheads of dished form to keep down the weight. Ballasting compartments are provided with efficient arrangements for submerging the tank to the sea's bottom and raising it to the surface again when required. The same people have designed a cylindrical storage vessel, 450 ft. long, with a mean diameter of 50 ft. 9 in. and a capacity for 20,000 tons of oil.

In this, as the oil is pumped out, water takes its place, so that instead of the barge rising in the water during discharge it gradually sinks, but always, within a small margin, floats at its loaded draught, a channel in the centre which runs for the whole length of the vessel, and from which all the valves can be controlled, giving the necessary buoyancy.

The stability of the vessel is secured by ballasting with pig iron and cement. This type of floating oil store would be very economical, if used for large volumes, as the steel required for its construction is only a third of that required for an oil tanker, and about half of that required for a cargo vessel of the same deadweight. The replacement of the oil with water, and of the water with oil, ensures an equal distribution of the load, minimising in that way the stresses a vessel has to endure when the loads are varied in amount and distribution.

In pre-war days the sea transport of oil in bulk was an important and highly profitable branch of shipping. When the hostilities come to an end, its importance and profit will be greater than ever.

OIL MILL MACHINERY.

(THE EXTRACTION OF OILS FROM OLEAGINOUS SEEDS.)

By R. A. BELLWOOD.

VEGETABLE oils have always been of enormous value to the human race, used as foods and for medicinal, lighting, lubricating, and a great number of other purposes. More recently an entirely new field has been opened for the use of vegetable oils—in the manufacture of margarine—and the quantities required for this purpose are steadily increasing; indeed, *an enormous advance has been made during the past year.*

The origin of the oil-milling industry would be difficult indeed to place. By more or less crude methods, with native-made inefficient plant, oils have been obtained from oil-bearing seeds, one might say, since the world began. It is not proposed here to deal with that part of the subject, but to refer briefly to the methods and processes in use to-day.

Until recent years, all vegetable oils were expressed, that is, the seed after suitable preparation was submitted to pressure and the oil forced out. To-day, an alternative method in the extraction of oils by means of chemical solvents is firmly established and in general use.

Concerning plant for expressing oils from seeds there are different types of presses in use. That which has been most favoured in this country is the Anglo-American system, probably on account of the fact that previous to the War the seeds chiefly treated here were cotton-seed, linseed, and soya beans, which lend themselves more readily to treatment by this system. A standard unit of Anglo-American machinery usually comprises the following:—

A magnetic separator to remove any iron from the seed.

A screen to take out the dirt and foreign matter.

A set of rollers to grind the seed.

A cooking kettle to heat and temper the seed.

A moulding machine, which takes the heated meal from the kettle and moulds it to cake shape for the press.

Four hydraulic open plate presses, each taking sixteen charges of meal from the moulding machine; these are enclosed in presscloth, which retains the solid material and allows the oil to escape.

A paring machine which removes the oily edges from the cakes as taken from the presses.

A set of edge-runner stones, to grind the parings from the paring machine; the parings being returned to the kettle and mixed with the new seed from the rolls.

A set of hydraulic pumps, with the necessary valves for operating the presses.

In addition, elevators and conveyors are supplied for taking the seed from one part of the plant to another, so that the whole works almost automatically. The cakes from the presses are the ordinary oil cakes, *which are* chiefly used as cattle food.

Another type of press is the "cage" or "perforated box" press, of which there are two

variations. In what is known as the "tramway system" the extracting boxes of the presses are removable—whereas in the other, the extracting boxes are fixed. These extracting boxes are built up of thin staves, which have one serrated edge, forming a box with innumerable fine perforations; these allow the oil to escape under pressure. In the tramway system, the boxes are filled with seed, which is then compressed in a preliminary packing press; more seed is placed in the box, and it is again compressed. The boxes are then taken on a truck to a finishing press, where the oil is expressed. In this way more material is packed into the press box than can be done with the stationary type of press. After the seed has been under pressure in the finishing press a given time, the box is taken away to the preliminary press, where the cakes are ejected and the box refilled. Preparatory cleaning, grinding and cooking plant is of course required with these presses; this is substantially the same as for the Anglo-American system, unless modified to suit the particular seed being worked.

"Cage" presses are usually employed in working up seeds having a high percentage of oil, such as palm kernels, copra, ground nuts, castor seed, shea, mowrah, etc. If high class edible or medicinal oils are wanted, the "cage" presses are generally employed, but the material is treated cold in the presses, no heat being applied to the seed, and this results in a better quality of oil being produced, known as cold-drawn oil. After cold pressing, there is still a considerable percentage of oil remaining in the seed, so that the cakes are ground up again, and may be pressed again hot, or, better, treated by the solvent extraction process, by which practically all the oil remaining can be extracted.

The tendency to-day is certainly to deal with practically all seeds by the solvent extraction process, the plant being suitable for seed with either a high or low oil content. There are a number of chemical extraction plants already working in this country, and there are likely to be more on account of the demand created by the war for palm kernel and such oils—previously, Germany had practically the whole of this trade in her hands. *During the past year large quantities of additional machinery have been erected on the solvent process.*

The products of the solvent extraction process are oil and meal, the latter being sold as a cattle food or as a fertiliser, according to the seed being treated. At one time there was a strong prejudice against extracted oils and meals, but that is rapidly dying out. Oil refining processes have been greatly improved, and the oil from chemical extraction plants can readily be used for edible purposes, chiefly the solvent used in this process is benzene, but there is no difficulty in employing other solvents, such as trichlorethylene, carbon tetrachloride, carbon disulphide, etc. *Great care, however, should be exercised in the choice of the solvent to be used.*

THE DIESEL ENGINE.

WITHOUT hurt to any military or civil interest, two important facts about the British development of the Diesel oil engine may be publicly stated:—(1) the number of the United Kingdom's makers of Diesel engines has very greatly increased since 1914; (2) the country's output of marine machinery of the type has been much more considerable than the man in the street is aware. How much of the experience gained will prove to be generally useful remains to be seen; but it is highly probable that the current activity will induce far-reaching enterprise along other lines.

In pre-war days there were licensees in the United Kingdom of the best-known Continental makers, including Swedish, Danish, Dutch, German, Belgian, Swiss, and Italian firms. Not all the licensees made engines for the propulsion of merchant ships. Swedish, Danish, Dutch, and German variations of the Diesel idea, adapted by British marine engineers and made for the most part in the United Kingdom, have, however, been installed in British-built vessels. Continental Diesels are also to be found in a number of our electrical power stations. A two-cycle four-cylinder Swiss engine of over 4,000 brake horse-power is used to generate a part of the power required by a well-known Belfast firm of shipbuilders.

Denmark, probably, leads the world so far as oil engines for the propulsion of ocean-going vessels is concerned. Its Burmeister and Wain four-cycle engine has a notably fine record in sea service, and a powerful combination of Copenhagen shipping interests is preparing important developments of the Høleby—another Danish four-cycle type. Messrs. Harland and Wolff are, however, large makers on the Clyde of Burmeister and Wain type engines, and their development of the idea certainly does not lag behind that of the Copenhagen concern. The Vickers-Diesel, which in one form has been more largely manufactured in the United Kingdom than any other since the outbreak of the war, is, to all intents and purposes, a native development. So is the Diesel which is made for various land and marine purposes by Messrs. Mirreles, Bickerton and Day, Manchester. Messrs. Doxford's (of Sunderland) opposed-piston type of two-cycle Diesel, whose performances have very favourably impressed Lloyd's Register, is another. A fourth is the Cammel Laird-Fullagar, which the famous armaments firm whose name is indicated are developing for marine work. About most of the more important British variations of the Diesel idea it would not be prudent to

be precise, but the known facts about them, taken altogether, justify the broad conclusion that our technical progress is, at any rate, in places highly promising.

The Diesel has, so far, been applied in merchant shipping only to the propulsion of comparatively slow vessels; but it is bound, the advocates of its use claim, eventually to displace the steam engine in all types and sizes of ships. The economy of the Diesel cargo vessel, or passenger and cargo vessel, is very marked, especially on routes which are convenient to oil sources or supply stations. The fact that coal is normally cheap in the United Kingdom and oil dear is of less importance than it seems to be, because a Diesel ship can do more work on a less weight and bulk of fuel than a coal-burning steamer. It can, in fact, bunker at the cheapest oil port on its route for the round voyage.

The Diesel ship's superior economy is not in any degree doubtful; per unit of capital investment her earning power is much greater. The oil consumption per brake horse-power hour of a marine oil engine of the type may roughly be assumed to be 0·4 lb. at full power. Taking the coal consumption of a modern reciprocating marine steam engine at 1·25 lb. per indicated horse-power (or about 1·47 lb. per brake horse-power), a Diesel ship would, therefore, be able to do the same work as a steamer of the same dimensions on 28 per cent. of the fuel weight.

At one time there was some ground for the criticism that the Diesel was less reliable in the rough and tumble of sea work than the reciprocating steam engine. So far as the best makes are concerned, there is no point in the objection now. British ships propelled by means of British-built four-cycle Diesels have made long runs of thousands of miles in all kinds of weather without a machinery mishap involving an involuntary stoppage. The best Diesels are now, indeed, as reliable as piston steam engines.

Diesels doing stationary work ashore are, as the records of public and private power stations show, highly efficient. Their economy over even turbo-generators is, in normal circumstances, very marked. Just now, of course, with fuel oil very dear and almost unobtainable, their superiority is naturally not so pronounced; but judging from the testimony of members of the Diesel Engine Users' Association tar oil promises to be a highly suitable substitute. As tar oil is a home product, there are obviously interesting possibilities in this direction.

BRITISH SMALL ARMS.

THE British people are pioneers and sportsmen by instinct. They are warlike only when circumstances compel them to be so. The irresistible appeal of the chase, the competitive spirit which brings the people together at the targets and at the traps, and the caution that, even in the absence of an aggressive spirit, dictates that thorough preparation for war is the best method of keeping potential enemies quiet, have combined to make gun and rifle making in Britain a prominent feature of our industrial activities. British firearms—particularly non-military weapons—have a standing in the world's markets second to none, even though the total output has not been so great as that of Belgium, or U.S.A., or Germany.

The first practical small arms were introduced about 1500. Henry VIII. foresaw the possibilities of the firearm, and he installed a number of Continental gunsmiths in the Tower of London to make and repair "harquebuses." A few of these smiths eventually started in business for themselves in the neighbourhood of the Tower, and their number gradually increased until London ultimately became an important centre of the industry.

To Sir Richard Newdigate, who represented Warwickshire in Parliament, Birmingham owes its first order for firearms. This he got from the Government towards the end of the seventeenth century, and since that time Birmingham also has been a great gunmaking centre. In a few provincial towns gunmaking has been practised, but the only real centres of manufacture in Britain have been, and are still, the two cities mentioned.

The London gunmaker has been principally renowned during the past century or so for his high-class double-barrelled guns and rifles. Such names as Manton, Nock, Lang, Purdey, Holland, Boss, Lancaster, and others will always be inseparably associated with the evolution and manufacture of weapons of this class, which until within recent years were turned out by highly-skilled hand workers, with the aid only of the simplest form of machinery. Modern machinery is to some extent now employed in roughing out barrels and actions, but the skilled gunsmith is still, and must always be, employed to impart to these fine productions the beautiful lines, the wonderful balance, and the regularity of shooting for which they are, all over the world, justly famed. Despite the existence of many fine gun factories in the United States of America, and a high import duty, London guns find a ready sale even in that market. The double-barrelled big-game rifles made up in London are also remarkable for reliability and accuracy, and for the up-to-dateness of the ballistics of the cartridges which they are made to shoot.

The Birmingham trade is of a more miscellaneous character. There are several makers whose best guns enjoy a world-wide sale, and compare very favourably with those of London makers, but the industry in that centre is principally engaged in making, partly by machinery, large numbers of the cheaper grades of shot guns, which come directly into competition with the mass of Belgian, German, and

American productions. There are also two big and famous small-arms plants where small arms are made entirely by "repeat" machinery. The outputs of the Birmingham Small Arms Co., Ltd., and Webley and Scott, Ltd.—the former consisting principally of machine guns, military rifles, and all kinds of sporting and target rifles, and the latter of shot guns, military and target revolvers and automatic pistols—are distributed in large numbers all over the world, and more than hold their own against the skilful manufacturing and commercial efforts of the great American and Belgian "repetition" plants such as Winchester, Remington, and Colt, of U.S.A., and Fabrique National of Liège.

The future of the British small arms industry certainly looks bright. Our gunmakers may, generally speaking, justly be accused of having been a trifle sleepy for a number of years prior to the war. Their methods had in many cases become obsolete, and their commercial enterprise was not so vigorous as that of our American friends in particular. The decline which was then apparent has been arrested. Means of producing have been thoroughly investigated. Gun workers have for the past four years mostly been engaged on repetition machinery, in which the power-driven milling cutter takes the place of the hand-driven file, and they will come back to their benches with modernised ideas. The manufacturers themselves have seen the folly of working so keenly against each other as they have done in the past, and are even now getting together for the purpose of acting cohesively as a trade against international competition.

Belgium had the biggest export trade—about £1,000,000 annual value—before the war. It consisted mainly of sporting guns, rifles, revolvers and pistols, and her principal markets were the Continent and South America. The U.S. manufacturers sold abroad some £700,000 worth of firearms, also principally of the sporting gun and rifle and pistol varieties. The British Empire—Canada and Australia in particular—took (to our discredit) a large share of this U.S. output. Germany had the third largest annual export figure to her credit—little below that of U.S.A.—but about two-thirds of it consisted of military small arms supplied principally to her Continental neighbours and to South America. Britain has had to be content with the fourth place on the export list, with a total of about £350,000—half that of U.S. and Germany.

Belgium cannot, unfortunately for her, recover her pre-war standard for some years after the war. Germany will no doubt be shut out of a good many markets, and small-arms buyers will thus look to Britain and U.S.A. There is every reason to believe that our small-arms makers, with their modernised plants and methods, their newly-created co-operative ideas, their new models already devised for after-war trade, and their determination to go after the buyer and to make exactly what he wants, will, assisted by a possible re-arrangement of import tariffs, give us the lead in export business, so much of which has in the past, for no good reason, been allowed to slip into other hands.

H. W. R. T.

B.S.A.

RIFLES & GUNS

EVERY SPORTSMAN

admires a B.S.A. rifle, no matter whether it is a high-velocity big game weapon or one of the smallest bores or air rifles used for pottering about the farm or garden. It is a perfect piece of craftsmanship, in which the work for generations of the best brains in the science of ballistics and rifle design has reached its culmination. Every B.S.A. firearm has behind it the guarantee of a wonderful organisation and the prestige of a company whose reputation and fame is world wide.

The B.S.A. Company can now, after four years of heavy war work, again supply those B.S.A. game rifles, target rifles, air rifles, rifle sights, and shot guns which have made a world-famous reputation.

Birmingham, England

THE WORLD OF AIRCRAFT.

By E. AUSTIN HURSON,

The first Aeronautical Editor of the "Daily Mail," Paris.

IT is difficult in these times to keep pace with the progress of aircraft. Scarcely a day passes without something new being accomplished in the world of flight. In the military world one of the most important things that falls to be chronicled is the success of the Independent Air Force under General Sir Hugh Trenchard. This special branch of the Air Service has carried the war into the country of the enemy, has completely broken the *morale* of the people, and done a great deal towards shortening the war.

In the ordinary fighting our aeroplanes have turned the retreat of the enemy into a rout, and in one case recorded a 'plane has actually acted as a decoy, and, by flying low over the back of a German trench, has turned the attention of the enemy and allowed our attacking party to take the trench.

An important new branch of the war service is the establishment of ambulance aeroplanes, carrying the proper paraphernalia for hospital work. It will be seen how important this is when it is recalled that in times of peace such a squadron could be held in readiness to fly to the scene of a railway accident or a mining disaster in a remote part of the country.

Rapid as the progress of aircraft has been in war time, it is likely to be more rapid still during the first few years of peace. Our great establishments are so equipped, our machines so trustworthy, and our pilots so well trained, that the commercial use of aeroplanes will be an integral part of international life.

One of the first feats to be accomplished will be the flight of the Atlantic, and the probability is that it will be by a British pilot. We may also expect to see the early establishment of aerial posts all over the world. During the war our efforts have been directed to building and equipping machines capable of carrying the maximum weight and flying the maximum number of miles. All that it will be necessary to do will be to substitute mail bags for the bombs,

and to build suitable aerodromes for the machines to land at.

This last is an important work which must be undertaken with all speed whenever the conditions permit. Large numbers of workmen will have to be drafted to the various points of the globe and the scheme carried out with the national spirit which has characterised Great Britain in the past. Just as the traveller used to note with pride that every port a vessel called at in the seven seas flew the Union Jack, so the great aerodromes of the world must be under British sway.

It will of course be impossible for us to disband the air forces which have done such magnificent work during the war. The Royal Air Force is the newest we possess, but it will be the crack force of the future, and second only to the Navy as a means of protection against sudden invasion. The air boats, which will be further developed and capable of carrying bigger crews and greater weights, will act as the eyes of the Navy and the merciless foes of U boats, while the coast patrols will be held in readiness to dash at marauding planes and to prevent them from dropping their bombs on our industrial towns and the civil population.

Long distance travel will be an accomplished fact in the near future, and space between such places as India and Africa will be annihilated by the aeroplane. Lord Montagu of Beaulieu and others have dealt at great length with the possibilities in this direction, and have familiarised the public with what is likely to be accomplished.

What I would like to emphasise as the national duty is the close study of every new phase in aircraft and continual experiments in the laboratory and workshop, to ensure that none of our rivals shall get ahead of us in the race that will ensue.

The Air Ministry ought certainly to be maintained in time of peace, and everything done to encourage the industry in the years which are before it.

PAINT.

By ARTHUR CASSON.

IT is impossible to give any idea as to the period when paint was actually invented.

I really think it never was invented, but simply grew, and, like all vegetable and mineral matter that has proved useful to mankind, it has gradually been improved upon from its crude earth state by the brainy men of all ages down to the present time, when it has reached its present high artistic standard, and become one of the world's greatest industries.

When the average individual gives a thought to paint at all, it is only when he wants his house, motor, etc., painted; but were he to give half an hour's study to the part paint plays in the world, and to the many industries it is used in, he would be astounded.

When was paint first used, and by whom? It is impossible to trace it. When a white man first visits a savage race, what does he find? Paint! True, in its crude form, but still it is paint, whether on the body, idol, or hut. I suppose in the prehistoric or stone age paint was used by the man who wished to be smarter than his fellows, and he more than likely made it in a hollow stone, and used for a brush the tail of a prehistoric animal. Again, people stand in wonder, when viewing the thousands-of-years-old Pyramids, but they do not give a thought to the wonderful paint used in so many ways thereon, and which still keeps its artistic colouring whilst the centuries fade away.

At the present time we are in the thick of the greatest war the world has ever known, and paint is one of the most important and necessary articles for the successful carrying on of same. Each shell that is fired has its coat of paint; each gun is painted in camouflage colours, as are also the many ships, forts, buildings, etc., in the war zone. Each aeroplane, motor-boat, war-wagon, hospital, etc., have their special paint.

What would the world look like but for paint? Surely a more sad and dreary place could not be imagined. From the millionaire who employs the leading firms of decorators to paint his mansion to the lowly cottager who takes home on a Saturday afternoon a tin of paint to smarten up his best room or garden gate in his leisure time, paint is his pride. The millionaire's rich saloons would look nothing without paint, and the thousands of pounds he pays to the leading artists and portrait painters, for pictures for his galleries, is again paid for paint on canvas.

The average man or woman is attracted by the small country cottage on account of the bright-coloured flowers and usually clean painted doors and windows. A mud cabin will look a lovable little place with nicely-painted windows and doors and bright flowers, but a dreary hole without them. The first thing a person looks to, when about to take a house or a flat, is the condition of the paintwork; a badly-painted house or flat is passed over by many a prospective tenant, although otherwise satisfactory. The property owner who keeps his houses, flats, etc., well painted is a wise man; they quickly let and are seldom empty. The hotel keeper or boarding-house keeper who keeps his place well painted is the best patronised, as also are the cafés, restaurants, tea-rooms, etc. The first firm to have brightly-painted tea-rooms and cafés was the first to make a fortune from such places; their white-painted fronts with gold letters attracted the patrons.

Furthermore, paint is a preventive against rot and decay, and is therefore a fine investment, not only for the house-owner, but for all businesses where a bright, attractive, clean appearance counts.

The ship-owner protects his ships from decay and corrosion with paint, and the best-painted ships make the quickest passages and use less coal, because a smooth painted hull gives the least resistance to the water.

Again, what makes all the difference between a slovenly-looking, dirty ship, motor-car or carriage, and smart-looking ditto? Why, paint!

There is an old saying that "a coat of paint covers a multitude of sins." This is well known and acted upon by the dealers who buy and sell old ships, cars, etc., and many fortunes have been made in this way, again owing to the paint.

Paint, through the work of the paint chemists and the invention of special machinery, is now within the reach of all, rich and poor alike, and being put up by the manufacturers in a ready mixed form, in all colours, and easily applied by a novice, a bright, artistic home can be made by those who desire it.

Life is made brighter and happier by the use of paint. The invalid quickly regains his health and strength when nursed in a brightly-painted clean hospital, and, *lastly*, when this War is over, and the ruined towns and villages are rebuilt, what is the last thing to be used to remove all traces of these terrible times? *Why, paint!*

ALL BRITISH—Both Firm and Goods.

CASSON'S WHITE

Possesses all the merits of the best quality WHITE LEAD PAINTS
and yet is **NON-POISONOUS**.

“KUREDAMP”

THE ONLY PERFECT WATERPROOFING PAINT.

An Absolute Damp Cure.

For Inside or Outside use, on Wood, Stone, Brick, or Iron.

“RIVERSEA” PAINT

Is manufactured on an entirely new principle quite different from all other PAINTS. Is supplied in any ordinary colour or transparent. Dries with a hard, durable, **ELASTIC WATERPROOF** surface, impervious to heat, cold, and atmospheric conditions, and thus becoming a perfect preservative for Iron, Steel, Aluminium, Wood, Stone, or Fabric.

CASSON'S ENAMELS, VARNISHES, DISTEMPER PAINTS,
for House, Carriage, Yacht, Motor, &c.,
Painting and Decorating,
ARE ALL OF THE HIGHEST STANDARD.

CYCLES AND MOTOR CYCLES.

By H. S. BILBE, M.I.A.E.

FOR several years prior to 1914 the British Cycle Trade had successfully met all competition in home, colonial, and most foreign markets, while for the highest grade cycles the superiority of the British machine was, and still is, unchallenged. In cycle parts also a considerable export trade has been built up. In regard to imports, while a quantity of cycle parts, accessories, and types have been imported from America and the Continent, the total of complete machines is practically negligible. During the past four years production has diminished till it is, at the time of writing, insufficient to meet the home demand, an opportunity which has enabled Japan to take up the manufacture of cycles and parts and the American manufacturers to extend their trade, but the demand is still for British cycles, and the trade is thought to be sufficiently well organised to regain and possibly, in view of post-war methods, to increase its hold on overseas markets.

It is estimated that there are at the present time fully $3\frac{1}{2}$ million serviceable bicycles in the United Kingdom. Owing to cycle manufacturing concerns being also engaged in other trades it is difficult to compute the total amount of capital employed in the cycle and motor cycle and allied trades, but at a conservative estimate this exceeds fifty millions, and prior to the War not less than 750,000 persons were wholly or partly employed in these trades. Since 1914 the manufacture of magnetos, formerly an industry in which Germany held a virtual monopoly, has been established, and in June, 1918, this important adjunct to the motor cycle trade employed a capital invested of over a million pounds and some 4,000 persons. Possibly one-sixth of these will be directly employed on motor cycle requirements.

The motor bicycle, despite the early inventions of Wolfmüller, Werner, and a few others, did not begin to become popular in Great Britain before 1900, when Belgian engines were sold in complete sets for fitting upon a strong bicycle of ordinary design. These early machines were top heavy, high built, and prone to skid, but their chief drawback was the primitive batteries used for ignition purposes. It was not until

1906 that the high-tension magneto began to be fitted and proved so dependable that the popularity of the motor cycle was assured. Following the introduction of the tricar, a machine designed to carry a passenger in front of the driver, the sidecar was introduced and proved very successful, despite the unscientific character of the device. It has, however, been responsible for the development of several valuable features of the modern motor cycle, notably change-speed gears and detachable and interchangeable wheels. Motor cycles have reached a stage where they cater for nearly all classes, at one end of the list being the elaborate sidecar outfit with 8 h.p. engine, three or four speeds, detachable wheels and electric lighting, at a cost of about £125, while at the other is the small-powered two-stroke light-weight, costing about £20, or perhaps the small motor set, or motor wheel for attachment to a cycle. Conditions are likely to change in the trade, which has hitherto shown a predilection for single cylinder machines of $3\frac{1}{2}$ h.p. or thereabouts, a type which has been brought to a very high state of efficiency. Another type almost wholly confined to this country is the horizontal opposed twin-cylinder engine, which will probably be further developed and made in several sizes. The $3\frac{1}{2}$ h.p. may find its popularity on the wane after the war, as post-war models are likely to be designed with a keen eye to Colonial and overseas buyers; this may result in a large measure of standardisation, and a reduction in the number of types produced. It is anticipated that the production of 4-cylinder motor cycles may be taken up also.

Approximately the number of motor cycles manufactured in the United Kingdom prior to the War was at the rate of 130,000 per annum. Already there are indications of important developments in relation to air-cooling, spring frames, lubrication, and better protection from mud and weather of machine and rider. Much has been learned from aero-engine practice as well as from the work accomplished by the motor cycle on war service. In this connection it is thought that the number of women employed as motor cycle drivers will result in an accession of feminine riders, and their requirements are already being anticipated.

The cycle and motor cycle industry has earned recognition by the part it has already played in the production of munitions; the appended tables showing imports and exports demonstrate its national value.

THE IRON AND STEEL WIRE INDUSTRY.

By H. D. LLOYD, Assoc. M.Inst.C.E.

THE manufacture of wire is of great antiquity; a sample of metallic wire made by the Ninevites some 800 years B.C. is in the S. Kensington Museum, while a fine specimen of wire rope (brass wire) found at Pompeii is now in the Museo Nazionale at Naples.

The practice of earlier times was to beat metal into thin sheets, and then cut it into fine strips or threads; this method is described in Exodus xxxix, 3.

Many centuries elapsed before any great improvement in the art of wire manufacture was recorded, when towards the end of the fourteenth century the use of the draw-plate is mentioned in the history of Augsburg.

It was not, however, until a still later period that the invention was introduced, first appearing in Germany, to which modern wire-drawing owes its development, viz., the revolving block to draw the wire through the draw-plate.

In Great Britain the first mechanical wire mill appears to have been established at Sheen, near Richmond, in 1663, while of the existing wire-manufacturing firms at least two of the leading works in this country have been established for upwards of 100 years.

The number of uses of wire is almost countless, ranging from telegraph and fencing purposes and wire ropes down to wire for wool-carding, wire nails, wire netting, and gauze, mattresses, sofa springs, cycle spokes, pins and needles, boot nails, umbrella ribs, book-stitching, hair curlers, mouse traps, and a host of others.

In the early eighties of last century Great Britain, up to then pre-eminent in the trade, began to feel the competition of Germany, both at home and abroad, and in the early nineties the United States of America also began to compete strongly in foreign markets, though the German competition has always been predominant.

Remarkable developments occurred in the German iron and steel industry during this period, and the wire trade, as an industry which afforded a high degree of employment and a particularly convenient form for disposing of large quantities of steel production, was fostered by Germany with the utmost care.

The wire industry is, moreover, one of immense importance in time of war, and doubtless the Germans had all these considerations in view when they developed their ruthless attacks upon the British wire trade by means of a dumping policy, supported by export bounties, rebates on carriage, etc.

Not content with selling the commoner forms of wire and wire nails in this country at a price appreciably below the cost of the home producer, the Germans saw to it that by a similar procedure in regard to the sale of steel billets and wire rods the British wire trade became dependent upon Germany and the Continent for a large proportion of its raw material.

The dangerous position in which the British wire trade was thus placed in the year 1914

may be readily understood; not only were our German competitors determined to prevent the development of the wire industry in Great Britain, but also to discourage the production of its raw material.

The outbreak of war made it necessary that the trade should be self-supporting, and no time was lost thereafter in taking the steps required for this purpose.

Valuable assistance was given by the U.S.A., who supplied wire rods to the British wire trade in the period during which the new British rod mills were being completed.

In the higher qualities of wire Great Britain has always been pre-eminent. The chief branch of the industry, which must be mentioned in this connexion, is that of wire ropes, of which about 100,000 tons were produced in 1914.

That the art of stranding wires and forming the strands into ropes was known over 1,800 years ago is proved by the specimen already referred to as having been found in the ruins of Pompeii.

This specimen is described as consisting of three strands each of fifteen wires stranded together in accordance with what is to-day called "Lang's Lay" and, therefore, not differing essentially from modern practice.

For centuries the art of wire-rope making appears to have been lost, and it was not until the beginning of the nineteenth century that the first modern application of the art re-appeared, when iron-wire ropes were used in a suspension bridge at Geneva. The wires were not twisted, but laid parallel and bound round with a wrapping of fine wire.

It was, however, not until about 1810 that the complete modern form of the art was regained, and the first British patent for the manufacture of iron or steel wire ropes was taken out by Mr. R. S. Newall in that year.

The process to which the wire rope industry chiefly owes its present important position, viz., the "patenting" or special heat treatment of wire, enabling same to be drawn to breaking strains over 100 tons per square inch, was a British invention due to the late Mr. James Horsfall, of Webster & Horsfall, Birmingham, and was brought into use in 1856.

Aerial wire ropeways have long been in common use, and the first patent for these was taken out by Mr. C. Hodgson in 1868.

The wire-rope industry is of great importance, more especially in time of war; wire ropes enter into the essential operations of collieries and mining of every description, in the form of hauling and winding ropes. They are indispensable for ships' rigging and hawsers, and a variety of war work on sea and land which may not at the present time be described in detail.

The extent to which wire ropes are used in connection with lifts, cranes, aerial ropeways, shoots, cable tramways, and engineering work generally is extraordinary, while the products of British wire-drawers and wire-rope makers are regarded throughout the world as being of the highest quality.

TUBE MANUFACTURES.

WROUGHT-IRON AND MILD STEEL TUBES OR PIPES.

By H. J. RHODES.

ALTHOUGH the manufacture of tubes from wrought iron and steel is a comparatively new industry, there must be many users of tubes, or pipes as they are just as often called, to whom the industry and the process of manufacture are more or less unknown. It seems very probable that the first tubes manufactured from wrought iron were intended for the barrels of guns, and used only for that purpose. One of the first instances of their application to one of those purposes for which they are now so largely used is reported in 1815, when William Murdoch, the pioneer of gas lighting, employed old gun barrels screwed together to convey gas in his works near Birmingham. The end of the war in Europe in that year had probably very greatly reduced the demand for gun barrels and thrown large quantities on the market. In many parts of the country to-day gas pipes are still spoken of as gun barrel. The need of wrought iron pipes grew rapidly, and a quicker and less costly method of manufacture from that of gun-barrel making had to be sought for, and this was discovered in 1825 by Cornelius Whitehouse of Wednesbury, when he invented the process of butt-welding by a draw-bench and dies.

The principles of his invention have been in use ever since for the manufacture of tubes by the butt-welding process, but, naturally, the methods of application have been greatly altered and improved.

The production of tubes by the Whitehouse invention did not for long fulfil all the requirements of the new conditions which were arising, and for which larger and stronger tubes became necessary than could be produced by the butt-welding process. The minds of many ingenious men were at work, and it was only after long and costly experimenting that, somewhere about the year 1842, the process known as lap-welding was established.

The methods of welding tubes known as butt-welding and lap-welding were, until comparatively recently, the only processes employed for the manufacture of wrought iron and steel tubes, and probably more than three-fourths of the world's requirements are still manufactured by these two original methods.

The butt-welding process is usually the process by which tubes from $\frac{1}{4}$ -inch to 2-inch bore are manufactured for gas, water, steam, and like purposes where the pressures are normal.

The strips or hoops are delivered to the tube mill from the iron and steel works of a length, width and thickness suitable for the size of tube to be made. The flat strips and hoops are brought to a welding heat in a furnace, gripped by tongs, and drawn from the furnace through a bell-shaped die. The die is shaped so as to gradually bring the hoop into the shape of a tube, the edges being forced squarely together and welded. The tube after being welded passes immediately from the draw-bench through sizing and straightening rolls to give the correct outside diameter and finish to the tubes.

The lap-welding process can be applied to all sizes of tube from $\frac{1}{4}$ inch up to as large as 6 feet.

The strips or plates are first of all planed or scarfed on the edges. The scarfed strips are then heated to a bright red heat in a "turning-up" or "bending furnace," from which they are drawn through a die so designed as to bend the plate into a tubular shape with the edges overlapping. The plate, when so shaped, is termed a skelp. The skelp passes into another furnace where it is raised to a welding heat, and is then pushed out at the front of the furnace into the welding rolls, which are set one above the other, each having a semi-circular

groove of a diameter equal to the external diameter of the tube. Between these rolls a mandril is held in position on a long bar, over which the revolving rolls rapidly carry the tube. Thus the weld is made by the pressure exerted on the lapped edges while passing between the roll surfaces and the mandril.

The method described of lap-welding through rolls is generally employed for sizes up to about 12-inch diameter, and diameters larger than 12 inch are usually welded by a different process. The plates are formed into tubular shape in plate bending rolls instead of through dies on a draw-bench. The tube in this form is then fed through a welding machine, where, instead of heating the whole tube, the lapped edges only are heated bit by bit by the application of water-gas, or carbon hydrogen flame, followed by hammers or rollers, by which the welding is effected along the whole length of the seam.

When the use of mild steel became general, a great deal of attention was directed to finding a suitable method of producing tubes direct from solid bars, by which means there would of course be no weld. These tubes became known as solid drawn or weldless tubes. A great deal of ingenuity was displayed, but the difficulties to be overcome were so great that it is only within the last few years and after the expenditure of very large sums of money that any of these processes proved a commercial success. By far the greater part of the weldless tubes made to-day are produced by what is known as the hot-rolled process. As a rule, cold-drawn tubes are only produced for certain special purposes, the cost of production being very much greater. The first operation in the manufacture of hot-rolled weldless steel tubes starts upon a billet of round steel bar, cut to such dimensions as will give the required size and length of tube.

There are a number of methods for piercing the billet and rolling it after piercing into a tube, and the process generally adopted is the following. The solid billet is heated, preferably in a gas furnace, where the highest temperature is conserved at the drawing-out end, so that the billet in its progress through the furnace is assured of a uniform heat. After being raised to a high temperature, the solid billet is fed through the piercing machine, the peculiar action of the rolls of this machine being to cause a displacement of the metal in the centre while at the same time forcing the billet over a mandril. Whilst still hot, the billet which is now in the form of a short, thick walled tube passes on to the rolling-out mill. The process of rolling down is carried out in a pilger or gap rolling mill over a mandril, and the tube is here, by a series of rapid passes, reduced to the required diameter and thickness, which, at the same time, has the effect of considerably elongating the tube. After pickling to remove scale, the tube is finally finished by receiving one or more cold passes through a die on the draw-bench. The effect of cold-drawing hardens the steel, and it is very necessary after each cold pass that the tubes should be annealed.

The processes of manufacture of wrought iron and steel tubes briefly described in this short article, viz., the welded and the weldless processes, together constitute the methods by which practically the entire requirements of the world are supplied.

The industry of tube-making has grown to enormous dimensions. There are large works in most European countries, and in Canada and the United States. Great Britain, the pioneer of the industry, is one of the largest producers.

BRASS FOUNDRING.

IN the brass foundry of the present day the alloys made embrace practically all those mixtures which have as their principal constituent one of the non-ferrous metals. In this branch of metallurgy the application of the laws of physical chemistry and the use of such scientific instruments as the microscope and pyrometer was generally recognised at a somewhat later date than in the case of steels. This was probably due to the fact that in some respects steels are rather more sensitive to comparatively small variations in the percentage of certain elements they contain, and also to the extraordinary influence which small changes of heat-treatment have upon their mechanical properties, etc. Phenomenally rapid progress has, however, been made during the past fifteen years or so, with regard to the application of scientific methods of control in non-ferrous metallurgy, and these have resulted in more economical working, and the production of material of a more regular and improved quality.

With the aid of the microscope and pyrometer a considerable amount of most valuable research work has been done in the direction of constructing what are known as constitution diagrams. These are charts or maps which graphically depict the ranges of composition and temperature within which the various constituents may exist. The term constituent as used in this connexion does not refer to the constituent metals in the mixture, but to the alloy constituents which may be formed by the union of the metals present. Diagrams of this kind are not merely of academic interest, but of real practical value, and are now used as guides in the manufacture and treatment of alloys in general. The advance which has been made in this direction is much more gratifying now that those engaged in the non-ferrous industries appreciate the necessity of such apparently pure scientific investigations to enable them to obtain the best results. This change in the attitude of manufacturers towards science has been brought about (1) by their desire to have a more intelligent conception of the difficulties they encounter, and (2) by the increasing severity of the specifications embodied in their contracts. There are indications that specifications will become more rigid in the near future. In order to meet these requirements particular attention must be given to the conditions of melting and casting. Thus the time taken, and the atmospheric conditions prevailing inside the furnace, during the melting of many alloys have a pronounced influence upon the properties of the cast metal; the maximum temperature attained whilst the metal is in the furnace and the temperature of the molten mass at the time of casting also have a marked effect on the quality of the metal. At one time the opinion was almost universally held by foundry workers that the higher the casting temperature the sounder would be the metal; this view is now well known to be untenable. Indeed, as a rule, the reverse is the case, providing the temperature is not excessively low. Generally speaking there is a range of temperature for melting, and another not very different one for casting, which give the best results as regards soundness; these ranges

depend upon the particular composition of the alloy. One of the most important questions concerning the production of really good castings, whether they are to be used as such or subsequently extruded, etc., is that of the gases which may be dissolved by the metal during the melting period, and more especially after it has become perfectly liquid. The chief gases that are dissolved in this way are hydrogen, carbon-monoxide, carbon-dioxide and sulphur-dioxide, and they are almost invariably present in the atmosphere of ordinary melting furnaces. The solubility of gases in the molten metals increases with the temperatures. When the metal is cast a large proportion of the gas held in solution is again liberated whilst the metal is in the mould, but under these conditions they cannot freely escape and therefore get trapped in the casting. In the more serious cases this leads to the formation of blow-holes which can be seen after machining, but in many instances no such defects can be detected by the naked eye, as the quantity of liberated gas is relatively small. Even when no blow-holes are formed the influence of gas upon the tensile and other mechanical properties may be quite substantial by the gas forming a discontinuous film at the crystal boundaries and thus preventing perfect metallic contact and interpenetration between the crystals, hence temperature control during melting and casting is a matter of considerable practical importance. At the present time, however, it must be admitted that there are many difficulties to be overcome before this ideal state of affairs can be applied to all kinds of foundry work. While the question of care in melting and casting should always receive adequate attention with the object of eliminating the disturbing influences of dissolved gases, this troublesome feature can be minimised by the judicious use of certain special elements. Thus phosphorus, manganese, silicon, magnesium, aluminium, etc., are widely used in a variety of alloys for the purpose of deoxidising and degassing. They are also used in larger quantities with the object of imparting special properties to alloys quite apart from their effect upon dissolved gases. For this purpose special alloys are made; thus we have phosphor-copper, phosphor-tin, manganese-copper, silicon-copper, nickel-copper and numerous aluminium alloys, all of which are extensively used in the modern brass foundry.

Many of the copper alloys are now extruded into numerous kinds of sections, and in this form they are extremely useful for the rapid production of special articles, when required in large numbers, by automatic machines. Though not fully appreciated by many, this question of output is only one, and in many instances by no means the chief, advantage of using extruded bars; by working with bars of this kind the user obtains a much more reliable and greatly superior article from the point of view of strength than can be got by the ordinary method of casting. Further, the makers of such bars can supply the same material in a variety of conditions covering a wide range of hardness, strength and ductility.

FIVE WORKS - - - OVER 3,000 EMPLOYEES.

UNITED BRASSFOUNDERS & ENGINEERS

LTD.

GUNMETAL VALVES, COCKS AND GENERAL STEAM FITTINGS.

Brass, Gunmetal, Cast and Malleable Iron Steam, Air and Water Fittings. Wheel Valves, Ordinary and Renewable Disc. Fullway Valves, Gate and Peets Type. Plug and Gland Cocks, Ordinary and Asbestos packed. Pressure, Vacuum and Hydraulic Gauges. Lubricating Devices. Polished Gunmetal Fittings of all kinds, including Pet and Gauge Cocks, Water Gauges, Whistles, Indicator Cocks and similar Fittings of every description.

CAST IRON STOP AND SLUICE VALVES, COCKS AND FITTINGS.

Cast Iron Stop and Sluice Valves, Plug and Gland Cocks, Soft Cast Iron and Malleable Pipe Fittings, Steam Traps, Pickering Type and other Engine Governors, Safety Valves, High Steam and Low Water Alarms, and Boiler Mountings of all kinds.

PLUMBERS' BRASSWORK AND GENERAL SANITARY FITTINGS.

Reliable Plumbers' Brasswork and Sanitary Fittings, Screw-down Bib and Stop Cocks, Bath and Lavatory Cocks and Fittings, Flushing Cisterns, Ball Valves, Soil Pipe Connections; Polished Brass, Copper and Plated Towel Rails. Copper Boilers and Cylinders.

SEMI-ROTARY (DOUBLE AND QUADRUPLE ACTING) &c. PUMPS.

Double and Quadruple Acting Semi-Rotary Pumps (Allweiler type) for Domestic and Trade purposes of every description. Contractors' Pumps, Ships' Pumps, Rotary Suds Pumps for Machine Tools, Plumbers' Force Pumps, Boiler Test Pumps, Spraying and Lime-washing Machines and Syringes, of which we are the oldest and largest makers in the trade.

INJECTORS, EJECTORS AND GENERAL JET APPLIANCES.

Injectors, Ejectors, Water Heaters, &c., of all leading types, Penberthy Type Injectors, Water Raisers, &c. Giffard, Gresham & Hall Type Injectors. Schaffer Type Injectors, &c., &c.

All our Injectors will exactly replace existing standard patterns, and combine the highest quality of material with the very best workmanship.

EXTRUDED BRASS AND BRONZE BARS, STAMPINGS AND SPECIAL ALLOYS.

Makers of all Sections of High Speed Turning and Screwing Extruded Brass Bar. Extruded Bars in Naval Brass, Naval and Manganese Bronze, Yellow Metal, Red Metal, &c., for Turning, Stamping, and Forging. Brass and Bronze Hot Stampings and Forgings, Brass Bolts and Nuts, and General Turned Work from the Bar. Special Ferro-Copper Alloys, Manganese and Phosphor Copper, Phosphor Tin, Ferro-Zinc, &c.

COPPER.

By L. H. QUIN.

THROUGHOUT the past year the copper market has been under the strictest control, both here and in America, and as a result price fluctuations have been few. America is by far the largest factor in the situation, and her refineries have been hard pressed to keep pace with the enormous consumption of the Allies in connection with war supplies. Ordinary industrial consumption of the metal has practically ceased, and an estimate put forward recently in the United States was to the effect that fully 90 per cent. of the American output was now being absorbed in one way and another in the supply of war material. There will most certainly be an enormous void to be filled as regards general copper requirements when the war is over, but whether or not it will require the whole of the present rate of output to fill it is the merest matter of conjecture.

It may perhaps be mentioned that the world's copper production in the twenty years period 1897-1917 increased by about 246 per cent., while if the world's needs continue to develop at the same rate during the next twenty years as during the past two decades, they will in 1937 be well over three times the present world's production of somewhere about 1,400,000 tons. The figures are certainly startling and deserve consideration. This leads up to another point, which is that the development and opening up of new copper deposits is a long and costly process. Since the war enterprise in this direction has been to a large extent at a standstill for many reasons, and this factor may play no small part in the next few years in determining prices.

In the summer months of 1918 the American authorities suddenly advanced the official price of refined copper from 23½ cents. to 26 cents. per lb., following upon which the London official prices were raised correspondingly on July 5, from £123 to £135 per ton for electrolytic copper, the American revision being due apparently to the urgent representations of United States mining and smelting interests. Costs had certainly increased very greatly, but there can be no question but that 23½ cents. left an enormous profit to the vast bulk of the producers, and the only inference that can be drawn is that it was considered advisable to offer extra incentive to the smaller and high cost properties to push operations vigorously.

Apart from America, we look largely to Australia for supplies, and the entire Commonwealth output available for export continues under contract to the United Kingdom. The Australian production is about 40,000 tons a

year, a substantial quantity, but, of course, far below our requirements in peace times, and efforts are now being made to increase our home ore output. Several hopeful properties are now being examined, and although it is too soon to wax enthusiastic the indications are hopeful.

One of the leading features in the copper trade in recent years has been the remarkable development in South America of United States capital and energy. From 37,000 tons in 1914 the Chilean output was raised in 1917 to 83,000 tons, whilst that of Bolivia increased from 25,000 to 45,000 tons in the same period. The increase is very welcome, for United States mines are feeling the effects of the war in the draining away of man power with shortage and rising prices of fuel and all other supplies.

British manufacturers continue to centralise their activities upon war orders and the utmost activity has been in force at all manufacturing works throughout the twelve months. This has had the inevitable result of greatly restricting trade connections with the large and valuable export markets, in some of which, India for example, Japan has been enabled to obtain a foot-hold. That our manufacturers, however, will resume their old connections overseas when conditions permit goes without saying, and they will at the war's end be probably in a condition of greater technical efficiency and with greater productive capacity at their disposal than at any former time.

The following table taken from *Quin's Metal Handbook and Statistics* shows the position of supplies during recent years:—

Mine Output	1914	1915	1916	1917
	Tons.	Tons.	Tons.	Tons.
Africa	23,755	24,000	35,000	30,000
Australasia	37,000	40,000	45,000	39,000
Canada	33,810	46,000	55,000	55,000
Chili				
& Bolivia	62,000	78,000	105,000	128,000
Germany	30,000	25,000	30,000	30,000
Japan	67,000	80,000	90,000	114,000
Mexico	34,880	30,000	50,000	50,000
Norway	11,850	12,000	20,000	20,000
Peru	22,515	32,000	35,000	40,000
Russia	31,345	28,000	30,000	20,000
Rest of				
Europe	4,000	12,000	12,000	12,000
Spain and				
Portugal	36,515	40,000	30,000	31,000
U.S.A.	540,000	620,000	643,000	836,000
TOTAL TONS	919,940	1,065,000	1,380,000	1,405,000

LEAD.

By L. H. QUIN.

LEAD is one of the most abundant of the non-ferrous metals, and one of the most useful, being employed in a multiplicity of ways in industry and commerce, both in the metallic form and as a pigment. Prior to the war the world's output was about 1,200,000 tons a year, the chief producers in their order of importance being the United States, Spain, Germany and Australia. Since Germany, however, set the world ablaze, statistics have been barely available, though from those which have come to hand it is evident that America has leaped forward, until, at the present time, probably fully half the world's total output is derived from the United States. Spain's contribution has been a variable quantity, but it is certainly well below the pre-war level, labour troubles and fuel difficulties being acute deterrents there to production. Of Germany and Belgium, of course, we know nothing. Australia, however, has gone ahead rapidly during the past few years, and is probably to-day turning out 60 per cent. more from her own smelters than in 1913. Australia has the largest individual lead smelter in the world, that of the Broken Hill Associated Smelters treating silver lead ores and concentrates from Broken Hill mines. The plant is at Port Pirie, in South Australia, and has an annual rated capacity of 160,000 tons of pig lead and of about 10 million ounces of silver. The Sulphide Co.'s works at Cockle Creek, N.S.W., is another important concern, with an annual capacity of about 60,000 tons of pig lead.

Lead ores are grouped into two divisions—sulphide ores and oxidized ores. Sulphides consist of galena, which is the main source of supply of commercial lead. Galena is found in this country in Lanarkshire, Northumberland and Derbyshire, but the deposits are of trifling extent compared with those of North America, Spain, Greece and Australia. Galena carries silver values, and the great aim of the smelter is completely to extract the silver from the lead.

Lead of commercial quality, known as pig lead, is the softest metal in daily common use, and when scratched with the nail shows a blue surface. It is malleable to a high degree, but is low in ductility, and lead wire, therefore, cannot be drawn to a thin gauge. It should be

practically free from silver, and should run about 99·98 per cent. pure, the impurities consisting mainly of iron, antimony, copper, silver, arsenic, etc., according to the class of ore from which the metal is derived.

In its pure form lead finds a very wide industrial application in the form of pipes and sheets, coverings for underground cables, storage battery plates, shot, etc., and huge quantities have been used since the war in the form of bullets for rifles, and in shrapnel. When used as bullets the lead requires to be hardened, and this is done by mixing it with antimony. The chief alloys of lead are type and stereo metal, both of which are alloys of lead, antimony, and tin; anti-friction metals which mostly contain antimony or antimony and tin, and solders and pewters, which consist of lead and tin.

Prior to the war large quantities of Australian concentrates were shipped to Europe for treatment and the bulk of them found their way to Germany and German controlled plants in Belgium. The strong line taken by Australia in connection with German influence in the metal trade, backed by the policy of the Home Government, has put an entire end to German activities in the British Empire as far as metals are concerned, and the Commonwealth production of soft lead (that is, refined lead, the silver having been extracted) will increase considerably. America's exportable surplus before the war, too, was controlled by German interests, likewise that of Mexico, and certain output in other parts of the world also came within the same control. Our own domestic production from native ores is quite small, say, about 20,000 to 30,000 tons a year before the war, so that we have been dependent practically wholly upon imported material. This position is hardly likely to be changed much, but in future our smelters and refiners will have at their command a much larger quantity of Empire lead than ever before.

An important branch of the lead trade is the manufacture of white lead, used so largely as a pigment, in which form mixed with oil it has a greater covering capacity than any other substance, while it is used also in the pottery trade. Red lead, an oxide of lead, is used in the manufacture of glass, certain enamels, and for jointing iron pipes, etc.

SPELTER.

By the Editor of the "Metal Bulletin."

SPELTER is one of the world's most abundant commercial metals, although since the war broke out no complete statistics have been available dealing with the world's production. This, however, must be about one million tons, compared with about 975,000 tons in 1913, the last year for which returns were compiled. Hun rule in Belgium practically removed that country from the ranks of producers in which before the war it took high place.

The metal, which in peace times was used mainly as a preservative for steel, has during the war assumed the important military significance owing to the fact that it is an essential component in brass, of which alloy hundreds of thousands of tons have been utilised for munitions.

The British galvanized trade alone before the war absorbed about 70,000 tons of spelter a year, but this trade has fallen into quite a secondary position owing to restrictions of one kind and another, and during 1917 it is doubtful whether more than 20,000 tons were utilised in this connection.

Spelter rolled into sheets and plates finds a large number of uses. Before the war foreign spelter was utilised in this country for this purpose, but now British spelter is employed, and the zinc rolling industry here is likely to be developed considerably in the future.

The principal countries producing zinc ores are the United States, Germany and Australia. Other countries producing zinc ores in quantities are Spain, Italy and North Africa, while Japan and other countries are making substantial headway with the development of their resources.

The leading zinc ores are blende and calamine. The Australian ores, which have since the war attracted a very great deal of attention, because during peace conditions they were mainly treated on the Continent, consist of tailings from the Broken Hill Mines, and are a mixture of zinc and lead bearing material. The zinc runs about 47 per cent.

Prior to the war the United Kingdom was dependent mainly upon Germany and Belgium for its supplies, and works in both countries, particularly the latter, drew largely for their raw material upon Australia.

Australia looms largely in the spelter position. Since the war the Zinc Producers Association was formed there to control and dispose of the output of zinc concentrates and metal produced from Australian ores. All the producers in Australia are members, and the Commonwealth and Imperial Governments are represented on the board. To treat the concentrates reserved

for Australia the Electrolytic Zinc Company of Australasia was formed with a capital of £1,200,000, and is now operating at Risdon, Tasmania, and regularly selling its output in the local markets and in India, South Africa, etc. With minor reservations, Great Britain will absorb the entire available supplies of Australian concentrates during the period of the war and for ten years after. Important plans have been formulated to enable the treatment of Australian concentrates in this country on a very large scale, and a determined Empire effort is being made to utilise our mineral resources to the very utmost. The reservation of Australian raw material in this way must be a hard blow to Germany.

It is useless giving statistical details regarding the British imports of spelter for the period since the war started. As stated already, however, great efforts have been made to render this country less dependent than before upon other countries, and the results of this policy will undoubtedly be felt in the future. It remains to be seen at what price peace requirements can absorb the world's enormously increased production when the war is over, and normal industrial channels long sealed are re-opened.

The development of the spelter industry in the United States is one of the commercial wonders of the war period. During 1913 the United States produced from domestic ores about 315,000 tons of spelter, and in 1914 about 310,000 tons, the total being increased in 1915 to 410,000 tons, in 1916 to 510,000 tons, and in 1917 to about 530,000 tons. The 1918 output will certainly show a falling off because of the closing of many plants owing to selling prices being no longer sufficiently remunerative to enable them to carry on at a profit.

Japan has also gone ahead fast; the production, which was about 8,000 tons in 1914, doubled in 1915 to 16,000 tons, and increased in 1916 to about 42,000 tons, with a further increase since then. Canada too, previously a negligible factor, turned out in 1917 about 14,000 tons. There can be no doubt that in the new commercial era which is coming the British Empire will constitute a highly important factor as regards the world's supplies of spelter.

Tabulated below are the extreme prices paid here during the last twelve years for good ordinary brands of spelter, as given in *Quin's Metal Handbook and Statistics* :—

1906.. £24 and £29½	1912.. £25 and £27½
1907.. 19½ " 28½	1913.. 20½ " 26½
1908.. 18 " 21½	1914.. 21½ " 40
1909.. 21½ " 23½	1915.. 28 " 115
1910.. 21½ " 24½	1916.. 44 " 110
1911.. 22½ " 27½	1917.. 46½ " 58

GALVANIZED IRON.

By JAMES WHITBY, Chairman Metal Trades Section, London Chamber of Commerce, and Chairman of the London Iron and Steel Exchange.

THE galvanized iron of commerce consists of steel sheets covered with a coating of spelter or zinc, the process being British, and dating from 1846, when it was patented in this country. The object of the process is to render the steel immune from oxidation. An unprotected sheet of steel exposed to the weather would rust and decay rapidly—covered with spelter it will withstand climatic and atmospheric influences for years without deterioration. The word "galvanized" has no real significance in this connection, for galvanizing plays no part in the deposition of spelter upon the steel, and the term seems to have been applied originally because spelter and iron together form a galvanic couple.

In the earlier days of the industry, the basis of the sheets was iron, and the term has survived, much as the term "charcoal" lingers in the tin-plate trade, though its original significance is only a memory. The original iron sheets were mainly produced in Staffordshire, but under pre-war conditions, the steel used was imported partly from Germany, Belgium, France, and United States, in the form of what was termed sheet bars. A number of works, however, made their own steel and sheet bars. Steel has practically superseded iron, for although iron sheets are still made, the quantity is negligible.

Under modern practice, after leaving the rolling mill, the steel sheets (then known as black sheets), are pickled in a mixture of hydrochloric or sulphuric acid and water, to remove any scale which may be adhering to them, and are then passed through a bath of molten spelter, from which they emerge completely coated.

The sheets in merchantable form are either flat or corrugated. The flat sheets find wide employment in the working-up trades, being used for the manufacture of spouting, ridging, flashing, baths, cisterns, tanks, sanitary dustbins, wheel-barrow, buckets, and farm apparatus, such as feeding troughs and the like, while the corrugated sheets, which normally constitute the major part of the output, are used for roofing and fencing purposes, and also for making tanks.

The corrugations impart great strength to the sheets, and most sheets have either eight corrugations or ten corrugations, such sheets being known as 8/3" and 10/3" respectively, but other specifications are also made for certain markets, for instance, 7/3", 9/3", 11/3", and 12/3".

The sheets range in length from four feet upwards, but the usual specifications are from five to ten feet. The basis thickness is always 24 gauge, which is understood to be taken in the black—that is, before the sheet is galvanized, but both thinner and thicker sheets are rolled, say, from 16 to 30 gauge.

The various export markets have their own peculiarities, both in the sizes and gauges of the sheets, and in the method of packing. For instance, Calcutta takes almost invariably 24 gauge sheets, 10/3", which are packed in bundles, while Bombay will have hardly anything but 8/3" × 24 gauge, packed in skeleton cases. Japan, the Straits Settlements, and Burmah buy from 24 to 30 gauge, but the latter are in greatest demand.

South America takes in most cases 24 gauge sheets in skeleton cases, but Australia will have

nothing but 26 gauge or thinner, packed in close felt-lined cases, to ensure the goods arriving in the very best condition. Australia also pays a higher price than other markets, as importers there only take best quality sheets.

India is, under normal circumstances, by far the largest market overseas, there being an enormous demand for buildings there, in connection with the tea gardens and estates, and so on, while large quantities are taken by the railway companies for the roofing of sheds, and sheets are used, too, in many other directions.

The "count" is very important in galvanized sheets, retailer's profits being materially affected by the number of sheets to the ton, and the desirability of getting the very utmost number has led to the cutting of the gauge, so that a few extra sheets can be obtained.

In the Eastern markets orders come over in many cases in which the gauge is mentioned, also the number of sheets per ton, but these in most cases do not agree, and the invariable practice is to execute the order in the number of sheets per ton, irrespective of gauge.

The galvanized sheet industry is a very important one in the United Kingdom, although, like others, it has been entirely disorganized by the war conditions, and in 1917 our exports were only about 19,000 tons against 566,000 tons in 1914, of which over 200,000 tons went to British India, nearly 110,000 tons to Australia, 27,000 tons to the Argentine Republic, 24,000 tons to British South Africa, 17,000 tons to New Zealand, and 22,000 tons to Canada. Germany never cut any great figure in the trade, owing apparently to inability to obtain the necessary degree of skill in rolling, whereas the British makers could always get the material very near to the calculated weights.

To-day in consequence of the cessation of imports all the big overseas markets are starving for supplies, hence, when peace comes, our manufacturers should be assured of a period of unexampled activity. British India, for instance, which in 1914 took over 200,000 tons, only had 64,000 tons in 1915, less than 10,000 tons in 1916, and a still smaller quantity in the succeeding year. Our manufacturers can be relied upon to make every preparation to deal satisfactorily with post-war conditions when the time comes.

The following table, taken from "Quin's Metal Handbook and Statistics," shows our total exports during recent years:—

	1914. tons.	1915. tons.	1916. tons.	1917. tons.
Dutch East Indies	25,861	11,984	4,803	
Japan	14,966	6,590	3,055	
Chile	5,954	1,785	1,270	
Uruguay	3,622	3,291	851	
Argentine Repub.	26,996	30,928	6,699	
British S. Africa	24,382	11,790	6,851	
British India	204,830	64,059	9,707	
Straits Settlements	7,559	7,300	953	
Ceylon	3,327	3,543	1,364	
Australia	107,128	62,203	35,744	
New Zealand	17,340	15,117	6,812	
Canada	22,548	6,949	1,363	
Other Countries	101,471	60,867	37,233

BRITISH GRANITE QUARRIES.

By H. J. GRACE.

GRANITE primarily consists of quartz and orthoclase, biotite, muscovite, hornblende, augite; and is holocrystalline. Other minerals entering into its composition are plagioclase felspar, oxides of iron, apatite, zircon, garnet, epidote, cordierite, sphene, topaz and tinstone; calcite, limonite, kaolin and chlorite being among the resultant products of decomposition. Commercially, the term "granites" covers products that evade the strictly correct geological definition, such as syenites, diorites, granophyres, gabbros, greenstones, and in some cases grits.

Aberdeen quarries yield a true and distinctive granite; Peterhead, Kemnay, Dalbeattie, Creetown and Ross of Mull being other deservedly renowned centres of the industry.

In England, Leicestershire, Cornwall, Cumberland and Westmoreland are rich in areas of supply; Warwickshire also possesses local sources. Wales has large areas extensively worked in Carnarvonshire. Ireland has a considerable supply in several districts, notably in Newry. The Channel Islands produce a large quantity of material, and the Isle of Man has an extensive area; but difficulties of transport hinder the development of the Manx industry.

The first step in the opening of any quarry is the removal of the top soil, or overburden, after which lifts or levels are excavated of varying depths. The accumulation of spring and surface water during the operation of sinking, and afterwards, necessitates almost continuous pumping where the quarries are worked in excavations or pits. The granite having been bored, the faces are divided into motions, averaging usually about 10 yards in width up to about 20 yards, with a set of men to each motion. Preparatory to blasting, holes are drilled into the rock by hand or by means of steam drilling machines, the customary depth being from 10 to 12 feet, the deepest about 20 feet, with a top diameter of $\frac{3}{4}$ to 4 inches. As a rule two to four charges are necessary, the first being so regulated as to be only sufficiently powerful to spring the rocks—that is, to loosen and open out their joints—the final stronger charge completing the work. Stones that remain unworkably large after the explosion are separately bored, charged with blasting powder, and reduced in size. Blocks intended for sundry specific purposes are roughly dressed below, prior to their removal to the surface for monumental, building, kerb or sett-making purposes and for the crushing or breaking mills. The carriage of the deposits to these mills is facilitated by tram-lines and effected by horse and mechanical power. In some instances the most up-to-date quarries have successfully adopted for this haulage an aerial power-worked cableway of extraordinarily

ingenious design, the system being suggestively known as the Blondin. Steel skips carried along this cableway have each a loading capacity of 50 cwt. and upwards. With clock-like regularity these receptacles are lowered empty, hauled up full, run swiftly overhead to the crushers, into the hoppers of which their contents are deposited, and then return to their starting place, to be again lowered and refilled. In the crushing mills the stones pass through breakers into rollers, falling into elevators and then into screens, which sort out the different sizes; rejections, or tailings, being recrushed.

In the dressing of stones for setts, kerbs, etc., the first or preparatory stage is carried out on the floor of the quarry, where the blockmakers shape them into the rough form in which they reach the settmakers and kerbdressers above. These settmakers exercise a wonderfully accurate judgment in deciding at sight how each block will shape best and with least waste under their hands. Into this judged shape it is wrought by heavy hammers, lighter ones being substituted for the finishing touches. For kerbmaking much larger blocks are used, the dressers wielding a variety of tools. For certain purposes, such as "Durax" setts, a stone-splitting machine of Danish invention, in the working of which a movement of the foot controls the action of steam hammers, has proved serviceable. The bursting of big stones of a size otherwise unwieldy has also to be accomplished by hand. An expert, with a sharp heavy hammer, nicks the line of fracture in about the centre, then draws the great block by striking it smartly at one end. After a varying number of blows it severs at the line made by nicking. Stones still larger are divided by what is known as the plug and feather process; the largest of all are drilled and blasted when the former process would be ineffectual. A trade is carried on in block or unbroken granite for breaking by hand on roads and in workhouses.

In consequence of the excessive pressure of work in all departments of the Home Office owing to the War, the published statistics of production have been very much curtailed, and the latest available returns are those for 1917, in which year the total production of igneous rocks in the United Kingdom was 4,239,406 tons against 4,843,176 tons in 1916. Limestone (other than chalk) was produced to the extent of 10,454,717 tons, against 10,541,573 tons in 1916. Separate figures for different areas have not been published. During the War, the imports and exports have been reduced to a very small amount. The last official returns prior to the War accounted for about 11,000 tons of granite exported in the year, about 874,000 tons imported.

ELECTRIC LAMPS.

By J. W. ELLIOTT.

THE growth of the Incandescent Lamp industry, and the importance of Electric Lighting, is well known to all. The discovery and invention of the electric lamp, worked out independently, and in some respects along different lines, to produce the filament (then of carbon), by the late Sir Joseph Swan and T. A. Edison, in the year 1879, was the beginning of an evolution in the world of artificial lighting, harnessing electricity as it were and producing a practical and an ideal illuminant.

The carbon filament lamp has been superseded by the Tungsten Drawn Wire Filament for all domestic lighting and for situations where there is little or no vibration. This change was a necessary corollary in the development of the field of electric lighting, to popularise it, by reducing the cost to the user and, at the same time, increasing the intrinsic brilliancy of the light. It may be best explained in this way, that whereas a carbon lamp of 16 C.P. consumed 60 watts, a Tungsten drawn wire lamp of 16 C.P. consumes only 20 watts, the former giving 16½ hours per B.T.U., whilst the latter would give 50 hours' light per B.T.U.

The carbon lamp, however, has not been entirely displaced; it still has its particular uses, where strength of filament claims first attention, and where electric energy is being provided at a minimum of cost. Hence we find these very largely in use on battleships, in mines, mills and installations where there is excessive vibration, intermittent shock or rough usage due to the peculiar working conditions, and where safety is a first consideration.

The change wrought, however, by the introduction of the Tungsten or metal filament lamp about eleven years ago, when prior to that for upwards of twenty-five years the efficiency of the carbon filament lamp had remained very much the same, was instrumental in a very rapid development in electric lighting, not only in this country but in the British Colonies and countries abroad.

A succession of improvements have taken place in the metal filament lamp. First Osmium and Tantalum gave way to Tungsten filaments. The original Tungsten filaments were produced by a squirting process, of a mixture of powdered metal and an organic binding material, but these filaments being very fragile, were difficult to mount, and required most careful handling both in transit and when in use. Next followed the Tungsten filament made of drawn wire, a process of compressing tungsten powder by

heating it, and then "swaging" it and working it into such a tough condition to enable it to be drawn into wire and down even as small as .0004 in. diam. for lamps of the lowest candle powers.

With a continuous length of wire it was found easy of manipulation and adaptable to all forms of lamps, not only those in the pear shape or cone bulb, but for manufacturing the fancy types, many of which are wound in spiral form on fine mandrels, in order to enclose the extremely long length of wire in a bulb of small dimensions. For instance, the double-ended tubular form of lamp, known as "Linolite," for cornice or picture lighting, is made up in this form.

The same spirallized form of filament is made up for candle lamps, known as "Kingolite," "Huntalite," etc.

The development of motor car lighting has been wonderfully aided by the production of all types of head light and side light lamps, and they are being manufactured with drawn wire filament and used with satisfactory results.

The most recent developments, however, that we have to record, are the Tungsten drawn wire lamps "gas filled," of a much higher efficiency than the vacuum type above referred to, and which burn at approximately ½ watt per candle. The bulbs are filled with an inert gas, nitrogen or argon, which enables the filament to be more fully incandesced or run at a higher temperature. These ½-watt type lamps at present are made in the higher candle powers only.

Next the "Pointolite" lamp, which has a globe of tungsten, and its source point light is an electric arc. Its high intrinsic brilliancy and point source illumination at once speaks for its usefulness and adaptation for lantern, film production, surgical and other optical work.

In regard to the manufacture of electric lamps in general, it is an ever-growing industry, methods of production are being improved and machinery is being introduced and perfected to increase the output of the country.

A feature worthy of note is the fact that we are not dependent on other countries, as formerly, for any of the component parts of the lamp. Glass bulbs are, and can continue to be, manufactured in this country; also the brass caps or lamp terminals with their insulation of vitrite, thus consolidating the industry and confining it to British labour in every particular.

THE REFRIGERATION, ICE-MAKING AND COLD STORAGE INDUSTRIES.

By LEUIG CHEW, M.I., Mech. E.

IT has often been prophesied during the past four years that the Great War would be won in the air, but having regard to the vital part that mechanical refrigeration has played in the camp, at sea and at home, as the means by which the meat and other food resources of the world have been diverted to our battle fronts and famine averted at home, by conserving food supplies for us and our Allies, it seems questionable whether (as an authority on the Commissariat has recently declared) victory was not actually decided for us in the air of the cold storage chamber.

By those who are unacquainted with the innumerable contact points of refrigeration with industrial and social economics, as a waste preventer and hygiene promoter, it can be but imperfectly realised how much of our health, happiness, industrial prosperity and social well-being is dependent upon it.

Although its development and successful application to commerce is of comparatively recent date, mechanical refrigeration is now the foundation of many of the World's most important industries, and it has rendered possible innumerable manufacturing processes which form the essential factors in the progress of human civilisation.

Briefly described in non-technical terms, refrigeration—or the mechanical production of cold—is the process by which the temperature of any body may be reduced and maintained at a lower temperature than that of the surrounding atmosphere, and this process involves the continuous abstraction of heat from the body being cooled, and the transference of that heat to some other body (such as and generally water) at normal temperature.

The theory and practice of machinery used for carrying out this process are based upon the first and second laws of thermodynamics, namely—

(1) The equivalence and mutual convertibility of heat and mechanical energy, and

(2) The necessity of an external agent for the transference of heat from one body to another at a relatively higher temperature.

In the early pioneer days of refrigeration, machines of the cold-air type employing atmospheric air as the refrigerating medium were used with considerable success.

A machine of this type, the first of which any authentic record appears, was invented about the year 1849 by Dr. John Porrie, of Apalachicola, U.S.A., but the first one to find wide-spread commercial application and with which the refrigerating industry may be said to have originated, was the Bell-Coleman Cold Air Machine made in Glasgow by James Coleman and John Henry Bell in 1877, this being the first machine to be used successfully to bring fresh meat across the Atlantic.

In these machines air was drawn into a cylinder and compressed by a reciprocating piston, the heat generated by compression being removed by water circulation, thus restoring the compressed air to its original temperature.

This cooled compressed air was then allowed to expand against the resistance of another reciprocating piston, becoming further cooled to a very low temperature by virtue of the mechanical energy expended during expansion, and it was then discharged into the insulated chambers in which the goods to be refrigerated were stored.

At about the same time scientists and engineers were experimenting with another system of refrigeration known as the compression system, which has since been universally adopted, entirely superseding the earlier cold-air system.

In the compression system a volatile liquid such as ammonia (N.H_3), or carbon dioxide (CO_2), is used as the refrigerating medium, the underlying principle being the physical property, which is possessed more or less by all substances, of absorbing latent heat at constant temperature while passing from the liquid to the gaseous state and of rejecting the same quantity of heat while undergoing the reverse process of condensation. This is the principle which is made use of in all modern refrigerating machinery of the compression type for the mechanical production of cold.

In practical application the ammonia or other refrigerating medium is caused to evaporate and absorb latent heat in tubular coils, around the exterior of which the air of the storage chamber, or water to be frozen into ice, or whatever other substance is to be cooled, is allowed to circulate, while the resulting vapour is drawn off by a compression pump, and discharged into a condenser, where it is cooled by circulating water to which it rejects the latent heat and is restored to the liquid state to be used over again in the evaporator coils.

One of the chief, though by no means most important, industrial applications of mechanical refrigeration is the manufacture of ice, more durable, and—by reason of the known purity of the water congealed—more hygienic and palatable than the natural product. The magnitude of this industry may be gauged by the annual consumption of manufactured ice in the United States, which amounts to 20,000,000 tons, no less than 3,500 ice-making plants being employed in its manufacture.

In Great Britain, where climatic conditions are less favourable to the ice industry, an annual consumption of some 400,000 tons is recorded.

Another application of more vital importance to this country is the cooling of cold storage chambers for the preservation of meat, poultry, fish, milk, butter, cheese, fruit, vegetables and other provisions of a perishable nature. In the United Kingdom, in addition to several thousand privately owned cold stores used in the businesses of butchers, poulterers, fishmongers, dairies, etc., there are some 250 public cold stores, with a total capacity of approximately 27,000,000 cubic feet of refrigerated space. This space is sufficient to accommodate some 8,000,000 carcasses of mutton weighing 200,000 tons, and aggregating in value about £14,000,000. One of the largest of these is the Cold Store of the Port of London Authority, at the Royal Victoria Dock, which is of 1,636,000 cubic feet capacity, accommodating 552,000 carcasses of mutton, of a total weight of about 13,800 tons.

The total quantity of meat imported into this country annually and preserved in refrigerated cold storage chambers before distribution to the various markets is about 600,000 tons, its value being somewhere about £40,000,000. The ships which bring this enormous quantity of meat and other food products from Australia, New Zealand, South America, and other parts of the world, are fitted with insulated cold storage chambers and refrigerating machinery to maintain them at the requisite low temperature. Although the number has now been greatly reduced by submarine warfare, before the war there were 251 vessels fitted with refrigerating machinery and having cold storage accommodation of about 43,951,000 cubic feet.

To illustrate the enormous responsibility which often hangs on the slender piston rod of a refrigerating machine, it may be mentioned that the value of the frozen meat carried in the refrigerated holds of some of the largest of these vessels often amounts to £150,000.

BRITISH COMMERCIAL MOTORS.

By HORACE WYATT,

Secretary of the Association of British Motor & Allied Manufacturers, Ltd.

THERE is no branch of the motor industry in which the special genius of the British engineer for the creation of substantial and durable structures has been more noticeable than in the development of the commercial motor vehicle. While legislation held back the industry of this country in the very early days of the motor car, British manufacturers were among the first in the field to develop the goods-carrying and public-service vehicle, and the products of our industry in this direction are unequalled by any competitor. Our road system and the distribution of our population encouraged traders to adopt motor transport more freely than was the case in other countries. The result was that, at the outbreak of war, the British Government had at its disposal very large fleets of vehicles of admirable quality. By that time the industry was experienced in the production of goods-carrying vehicles of a great variety of types, dealing with loads varying from a few cwt. up to five tons or more. It had also brought the motor omnibus and its kindred vehicles, the motor charabanc and coach, up to a high state of perfection. Further, it had turned its attention successfully to many specialised products such as municipal vehicles, motor fire engines and escapes, ambulances, tower wagons, motor rollers and mowers and tractors for use on the road and on the land. In all these directions and in all parts of the world the industry has obtained a high reputation.

During the past four years, it has further developed to three or four times its pre-war dimensions. Meanwhile, it has both suffered and profited. It has profited inasmuch as it has obtained increased knowledge of the economies and advantages resulting from the concentration of output upon a single model produced in quantities considerably in excess of the previous total output of a number of types. It has also profited from those lessons which are to be learned by any manufacturer whose products were originally primarily designed for use under favourable conditions, but who finds those products compelled to work under almost the worst conditions possible. It follows almost inevitably in such a case that any faults or weaknesses make themselves evident, not in years, but in months or even days. A pre-war vehicle fitted for the comparatively good roads of Great Britain may have been open to criticism when applied to the vastly inferior roads of younger and less developed countries. During the war, British motor vehicles have worked on every kind of surface. They have traversed millions of miles of broken pavé, they have run through marshes, across open country and over sandy deserts. They have experienced extremes of temperature. Every part capable of giving trouble under any of these conditions has had every opportunity of doing so, and that troubles have been so unfrequent reflects great credit upon the manufacturers concerned. It may safely be said that, when the War is over and the industry is able to turn again to its normal markets, British industrial vehicles will be found perfectly fitted for use wherever motor vehicles can run at all.

Henceforth, the industry will continue to benefit more and more owing to the existence of machinery

for co-operative action, necessitated in the first instance by war conditions. These brought into existence the Association of British Motor and Allied Manufacturers, which acts as a centre for the interchange of views and experiences and for the development of policies calculated to strengthen and extend the industry, safeguarding it during the period of reconstruction and helping it to develop the world's markets for British vehicles.

Meanwhile, the industry has suffered to a very serious extent. It has been debarred from cultivating its markets at home and abroad. Foreigners have done business in the Empire overseas and in foreign countries, while British manufacturers have been obliged to refuse orders. Even at home British vehicles have been commandeered by the thousand and, where necessary, replaced in the early stages of the War by the products of foreign factories. Thus the goodwill of the industry, accumulated steadily during the early stages of development, has been torn away from it through no fault of its own. Goodwill is an expensive commodity and is not easily recovered. There are those who envy the motor industry its apparent prosperity during the War. It is questionable, however, whether they have considered what it will cost to regain the lost goodwill and how far it may be possible to pay for that operation if the bulk of the apparent profits have gone in the payment of exceptional taxation. Unquestionably this industry needs and deserves reasonable safeguards against the competition of the foreigner during the period of reconstruction.

The industry has shown itself to be essential. The maintenance of armies in the field depends upon its products. Motor vehicles are responsible for the carriage of their food and ammunition, for bringing up their guns, for evacuating their wounded, for rapid concentrations at certain points, and for a score of other purposes. In response to the national demand the industry has extended itself and in so doing has taken great risks. The old markets will no longer suffice. Business must be done on a much bigger scale than hitherto. We need a clear realisation, on the part of the nation and the Government, of the necessity of supporting this industry during the crisis which must be passed through before it will have attained a proper balance between new demands and increased supplies. What applies to the industry applies equally to its workers. They are essential to the continued existence of the Empire, and their just claims must not be neglected when the War is over. Our arrangements must be such as to enable the manufacturers to continue to offer good continuous employment on a really adequate scale.

Their ability to do so is threatened not only by temporary loss of goodwill but by the fact that the Government has in its possession huge numbers of motor vehicles which will presently be no longer required. The most reasonable means of disposing of these would be to pass them direct to the manufacturers for repairs, subsequently employing manufacturers and their selling organisations as agents for disposal of the surplus lorries. If any other course be adopted, the goodwill of the industry will be further threatened.

On the other hand, given fair treatment and a full opportunity to compete on equal terms, the British commercial motor industry will unquestionably retain the supremacy gained by reason of the high quality of its products which, as the result of war experience will, from now onwards, be even better suited to operate in all parts of the world where roads of any kind exist at all.

THE COAL TAR COLOUR INDUSTRY.

THE coal tar colour industry (ignoring the earlier discovery of the yellow colouring matter "picric acid") is generally regarded as having begun with the discovery by the late Sir W. H. Perkin in 1856 of a mauve colouring matter derived from coal tar. A works was started at Greenford Green, in Middlesex, for the manufacture of this colour, and the manufacture of other colours subsequently discovered was in due course undertaken. Scientifically and commercially, therefore, this important industry is of British origin. The industry continued to grow, but, for a number of causes, which cannot be adequately treated in this space at present available, the development took place almost entirely in Germany, and during the two or three decades preceding the outbreak of the present war the various important industries in this country which require synthetic colouring matters were mainly dependent on German sources of supply.

Some idea of the general importance of the industry may be gleaned from the following figures. In 1913 we imported £1,731,000 worth of synthetic dyestuffs from Germany and £146,000 from Switzerland, and it is generally assumed that dyestuffs to the value of about £100,000 were purchased by British consumers from British makers, which figures show a total British consumption of approximately £2,000,000 worth of synthetic dyestuffs. Further, in 1913, £177,000 of British-made dyes were exported, which means that the British makers contributed less than £300,000 worth of synthetic dyestuffs to the world's markets (including Germany), whereas the Germans probably contributed more than £10,000,000 worth to the world's markets (excluding Germany). The enormous preponderance of Germany is thus easily recognised. It should be noticed that India and China were amongst the most important of the overseas markets.

It is not, however, the actual value of the dyestuffs which makes the industry so important, as the much greater value of the outputs of industries dependent on synthetic dyestuffs, notably the great textile industries of this country.

It is impossible here to examine in detail the importance of dyestuffs to the various dye-consuming industries, and the example of the cotton industry must suffice. It appears probable from an examination of official statistics that the amount paid by manufacturers of cotton goods in 1913 to firms engaged in bleaching, dyeing, and cognate processes, for operations involving the use of dyestuffs, exceeded £9,000,000, or more than four times the value of the total consumption of dyes in the United Kingdom. This is value of work only, and not the value of the dyed and printed articles. These dyed and printed cotton goods are consumed all the world over, and the value of the exports of dyed goods in 1913 (excluding such articles as hosiery, lace, ribbons, etc.) exceeded £30,000,000. These exports were sent very largely to British and other ports in Asia, where an increasing market is to be anticipated. Taking the dye-consuming industries together, it has been estimated that the value of the goods made in the United Kingdom in a year, the manufacture of which involves the use of synthetic dyestuffs, exceeds £200,000,000.

One of the first results of the declaration of war was the realisation by the Government of the dependence of the vital British textile industries on German dyestuffs, and as a result of

the work of a Committee appointed by representatives of the dye users, at a meeting held at the Board of Trade, a new dye-making company was brought into existence which has the character of a national undertaking. Subscriptions were invited from consumers of dyestuffs, and the Government promised to advance as a loan £1 for every £1 subscribed by the public up to a total share capital of £1,000,000 publicly subscribed, and thereafter £1 for every £4 subscribed by the public up to a total share capital of £3,000,000 publicly subscribed. The total capital resources of the company were thus to be £4,500,000. In addition the Government transferred to the Company a loan of £200,000 made to Read Holliday & Sons, Limited, and also promised a grant of £100,000 to be spent on research work during ten years. A report issued to the shareholders in October, 1917, stated that the share capital was £942,000, and the Government loan £1,142,000, making the total capital of the Company over £2,000,000. The Company also as a result of its second year's working paid its maximum dividend of 6 per cent. and wrote off £200,000 from the cost of new construction. The Company also paid its maximum dividend last year.

The Company purchased the undertaking of Read Holliday & Sons, Limited, at Huddersfield, Yorkshire, and large extensions to those works have been made. After careful investigation and inquiry the Directors decided to proceed with the construction of new works in Huddersfield for the manufacture, not only of the finished dyestuffs, but also of the "intermediate products" and basic materials which are required in the industry. The Company appointed a Technical Committee, under the chairmanship of Dr. M. O. Forster, F.R.S., and it also possesses a Research Council, consisting of University Professors and technical members of the staff, and presided over by Professor W. H. Perkin, F.R.S. Good progress has been made, and much of the new plant erected is in operation, but the Company's activities are naturally affected by war conditions which place limitations on the supplies of raw materials, new plant and labour.

The suggestion that the largest dye-stuff manufacturers should amalgamate has been made from time to time by persons interested in the future of the British dye-making industry, and a number of schemes for bringing about such an arrangement have been proposed and considered. A scheme was ultimately proposed for the amalgamation of the undertakings of British Dyes, Limited, and of Messrs. Levinstein, Limited, of Manchester, which the directors of the former Company placed before their shareholders at an extraordinary general meeting held on August 21, 1918, where the scheme was approved. The necessary steps are now being taken to carry the shareholders' wish into effect.

The difficulties of the problem of establishing a dye-making industry in the United Kingdom should not be underrated, and it is now generally realised that it will take some years to make the industry successful. The manufacture of the intermediate products had been concentrated upon by the Germans, and they produced them in large quantities at cheap prices, and the British dye-maker found it more profitable to make his dye from imported material. The intermediate product-making is, therefore, the chief difficulty.

Synthetic Dyestuffs

THE COTTON INDUSTRY OF GREAT BRITAIN.

By CHARLES STEWART, Editor of "The Cotton Gazette."

THIS highly important industry is practically carried on in Lancashire, mainly controlled by the Liverpool and Manchester markets—the former city being the principal port for importing and distributing the raw material, Manchester as a centre being especially identified as the hub of spinning, weaving, and distributing the finished product.

The cotton industry of Great Britain is the largest of its kind in the world. Rather more than 2,000 mills employing 665,000 operatives (under peace conditions) are occupied in housing roundly 61,000,000 spindles and over 800,000 looms, involving an annual consumption of some 4,000,000 bales of cotton of various growths.

The world's cotton mills number 6,443, operating 154,000,000 spindles and 2,800,000 looms. The world's cotton operatives number some 2,930,000, and these totals cover the industry of no less than thirty-nine countries, our own included.

Great Britain's percentage of the whole in mills is thirty-one, her percentage of spindles is forty, her percentage of looms is twenty-eight, her percentage of operatives is nineteen. These figures apply to normal peace conditions.

The cotton industry of Great Britain commences on the quay or in the dock where bales are first landed from abroad. No less than 748 steamers carried cotton to British ports during the year 1915. This in the first year of the war. No less than 5,042,000 bales were landed, the bulk going up country. Note.—3,140,000 bales were landed in 1917, but number of carrying ships not published. There are no conclusive available statistics related to the labour employed in the handling and forwarding of cotton on its arrival in this country, not a boll is grown here. There are no available statistics to show the extent of the labour employed from the ship to the warehouses, to the railway or canal, en route to the mills. Bales do not move by themselves.

London as a market for actual cotton is not now of any consequence. Liverpool and Bootle accommodate about 620 warehouses for practically exclusively cotton storage with an approximate capacity of 2,000,000 to 2,500,000 bales. The largest stock on record held in these warehouses at one time having been 1,860,000 bales.

The Manchester Dock Estate and Bridgewater department of the Ship Canal can warehouse about 215,000 bales, of which, say, 150,000 bales is estimated as representing the greatest quantity yet accommodated in Manchester and Salford at one time.

A very large proportion of railway, canal, and road motor transits with their attendant labour is all part and parcel of the cotton industry of Great Britain, but to realise the actual widespread cotton interest of this country, the hitherto unclassified arteries of machinery, and their manual service must be associated with the industry as a whole.

Nor is this by any means all or nearly all.

The Liverpool Cotton Association consists of 536 members of position, embodied in 260 firms,

the office staffs of each varying from, say, six to twenty or more, expert responsible salesmen, cashiers, bookkeepers, clerks, and the like. Incidentally no less than 220 officers, non-commissioned officers, and men of the staffs of Liverpool cotton firms have already laid down their lives for their country and empire in this war.

The bulk of the members of the Manchester Cotton Association are mill-owners, whose main activities are centred in the mills, or other kindred works and factories already enumerated. In addition there are no less than 240 firms in Manchester and Salford in business as cotton yarn agents, 220 as cotton cloth agents and merchants, whose yarn and cloth distributing operations exploit fields in practically every corner of the globe. All these have their warehouses, offices, and staffs, and represent the cotton industry just as much as the mills themselves and their first-hand operatives. Further, there are enormous works devoted to the manufacture of cotton machinery, employing thousands of the most expert mechanics in the world. Bleachers, dyers and finishers swell the total.

To draw a definite line as to which specific district in Lancashire uses cotton of a particular growth in its conversion from the raw state into yarns and cloth would scarcely convey information of much value to the general public. Oldham and its immediate area of many townships spins mostly cotton of American growth, and a proportion of East Indian, which growth has latterly—through scarcity of American—found renewed appreciation by home consumers. The Bolton and South Lancashire areas use principally cotton of Egyptian growth, and long stapled American. Rougher fibres, such as Peruvian, are manipulated in the few Yorkshire and Midland mills, and are largely mixed with wool for hosiery and the like.

The African yields created under the auspices of the British Cotton Growing Association are absorbed variously. A great future is ahead for Empire grown cotton.

The war has obviously exercised an abnormal influence on every branch of the cotton industry, through freight and transport difficulties of the raw material, involving with the coming out of man-power, and voluntary woman-power, the shutting down of about half of the spinning and manufacturing machinery of the United Kingdom. This is working to the particular advantage of India and Japan. Nevertheless, when peace comes, a world now starved for cotton goods will for long require every pound of yarn and yard of cloth that the entire world's machinery can produce. Strikes and the like will largely hand over Great Britain's long time cotton industrial pre-eminence to other countries.

A recent expert calculation has established that a prolonged strike of Lancashire cotton operatives would involve about one million workers (because it would affect the kindred trades, bleaching, dyeing, finishing and calico printing, and other independent industries).

Awarded the Certificate of the Incorporated Institute of Hygiene.

WOOLLEN AND WORSTED YARNS.

By the Editor of "The Wool Record."

THE writer assumes that the reader has little or no knowledge of the immense business in yarns done annually by spinners in the woollen and worsted industries. It may be best to state that woven textiles cannot be made without yarn, and anyone having the opportunity to go through a mill would be wisely advised to do so.

To-day (and much more so in normal times) an immense variety of qualities and lengths of woollen and worsted yarn is made. The word "length" is used technically to signify the smallness to which wool can be spun. It would occupy too much space to enter into a full explanation of the word "count"; suffice to say that the difference in cloths is entirely due to the difference in the character and counts of yarns used. Some idea of the value of our export trade in yarns will be gathered from the following, showing weight and value of woollen, worsted, alpaca, and mohair yarns exported during the years named:—

Year.	Weight. lb.	Value. £
1858	24,069,808	2,966,923
1870	36,605,076	5,182,926
1880	33,464,300	4,222,693
1890	54,042,400	5,260,925
1900	72,568,000	6,123,349
1910	94,253,900	9,046,394
1911	91,081,160	8,919,688
1912	87,888,900	8,225,567
1913	80,415,300	8,040,415

The value of woollen and worsted yarns has been emphasised in a remarkable manner during the last four years of war. The difference between woollen and worsted yarn cannot be explained in the available space, but the value of wool as the foundation of all yarns required to-day for clothing for our soldiers and sailors and those of our Allies, can be emphasised. It has been well said that a soldier fights on his stomach, though that is only half a truth. There have been two exhibitions of German textiles at leading centres in England during the past year, German soldiers' uniforms, underwear, etc., being on show in Bradford recently. The latter made it plain to what shifts the enemy is put for the want of good wool, and every Britisher has reason to be thankful that the British Government has been able to put its hand upon an adequate supply of good sound wool from which to spin the woollen and worsted yarns for our fighting forces. Without good wool yarns, sound wearing clothes cannot be produced, and the soldiers and sailors of Great Britain and her Allies are to-day facing the common foe clad in very good suits and underwear. The quantities produced are colossal, and every soldier has been provided with an excellent outfit.

Woollen and worsted yarns have played a very large part in the fabrics required. The reader may ask: What are the essential characteristics of these two kinds of yarn? They are both produced from wool, the difference being brought about by the principles on which they are spun and the type of raw material used. A woollen yarn is fuller and looser in handle than a worsted,

the latter being smoother and often of greater tensile strength. The difference is seen in the wear and appearance of the cloth. For soldiers' uniforms, what is known as tartan serge is made into trousers, while drab serge is made into tunics or coats. At one time these were made from solid worsted yarns, and, while sound and well made, they were not regarded as ideal for our fighting forces. In providing for a soldier, the great need is to see that he is clothed in good, sound, warm clothing, and it is a fact that fabrics made from woollen yarn retain the heat of the body better than if made from solid worsted yarns. Yet the latter are stronger and will usually wear better than woollen fabrics. The War Office officials (Cloth Section), in order to combine the two properties, decided that the warp of the khaki should be worsted yarn and the weft woollen yarn, this combination producing the maximum strength and heat-retaining properties. The result is that almost every soldier on the field to-day is clothed in this way. All underwear, including stockings, is made from worsted yarns, and anyone who will carefully examine the complete outfit of a soldier or sailor will see that they are well equipped to face the rigours of a varying climate like Great Britain and northern Europe.

The production of yarns for the civil trade in war times covers a big field, including fabrics for wear by both sexes. Of course, wool is the basis of the woven fabrics, yarn forming the warp and weft out of which the cloth or dress goods are made. So carefully is wool sorted, that the list of qualities ranges all the way from 28's to 100's. When wool is spoken of as being of 40's quality, we mean that it should spin to 40 hanks, each hank measuring 560 yards, the whole weighing 1 lb.; 60's quality meaning 60 hanks of 560 yards, to weigh the same. The raw material must be carefully sorted, otherwise the resultant fabric would present a very motley and uneven appearance. Yarn spinning being a highly technical industry, it requires considerable experience and knowledge to produce the article required, and if the materials in question are poor and tender, no sound yarn or cloth can be made. Readers can take for granted that no matter what class of fabric they wear, the colour, design, and effect are largely the outcome of the variety of yarns used as warp and weft.

We have no space to touch upon the avenues of consumption into which yarn goes, but in pre-War times a big business was done with Germany, France, and Belgium, particularly in hosiery yarns. A portion of this business is certain to remain in the hands of France and Belgium, but the feeling generally favours the adoption of Continental methods of mule spinning in order to retain a large portion of this yarn business done with German firms. Hosiery yarns can be mule spun in this country quite as effectively as in Germany, and we are certain to see considerable development on this head when the War finishes. The fact is remarkable that spinning machinery both for woollen and worsted yarns has been exported to almost every country in the world, there being no other source for real good yarn-spinning machinery except England.

WOOLLEN INDUSTRIES.

By R. TALBOT OVERTON.

BRITISH woollen industries, from a remote period in British history, remained the capital source of national wealth until the development of the cotton trade towards the close of the eighteenth century.

The Colonial developments of the seventeenth, eighteenth and nineteenth centuries, with the invention of the spinning frame and power-loom, supplied an impetus that carried the trade far and quickly ahead.

The chief oversea sources of supply of raw wool are Australia, New Zealand, South America, South Africa and India; China, Persia, Russia, Turkey, Egypt, North Africa, Spain, Portugal and other countries also figuring on the list, even Iceland contributing a quota. The supplies from the East and Russia are considerable.

Woollen textiles are divided into three general classes of fabric, in the manufacture of which three principles are operative—the woollen, worsted and “stuffs”—and to a great extent these principles are localised in practice. At one time the famous products of the West of England and parts of Scotland were almost wholly those of the first-named principle, the output to-day being much more varied. While re-manufactured materials, cotton “sweepings,” and “fud” and “flocks”—the wastes in the manufacture of woollens and worsteds—are used in the making of the cheap cloths of Batley, Dewsbury and the Yeadon districts in Yorkshire, nothing but the genuine material at its best enters into the composition of the unsurpassable best cloths of the “West Country” and certain defined Scottish areas. Leeds and its districts adhere in the main to the woollen principle, Huddersfield to the worsted, and Bradford to the “stuffs.” But both Bradford and Leeds make worsted fabrics in large quantities, and Huddersfield, working in part on the woollen principle, turns out cloths with both woollen and worsted properties. The woollen differs from the worsted principle in the construction of the yarn (thread), or the arrangement of the fibres of which the threads are composed. In the “stuffs” trade cotton warps are the rule, though warps of worsted, wool, silk and linen are also in use, the wefts being usually of Botany (the original Australian variety) and English wool, mohair and silk.

A hundred years ago the value of the woollen yarns and piece goods distributed from the manufacturing centres of Great Britain and Ireland was about £17,000,000, as against an average of about £55,000,000 of late years. In 1913 our total imports (including 122,000,000 lbs. of imported woollen rags) amounted to 1,016,000,000 lbs., and our home product to 125,000,000 lbs. In 1914 (the first year of the war) these figures fell respectively to 885,000,000 lbs. and 121,000,000 lbs.;

but in 1915 the grand total rose to 1,179,000,000 lbs., of which 122,000,000 lbs. was produced at home. The weight of foreign wool exported in 1913 was 308,000,000 lbs., and of domestic 29,000,000 lbs.; in 1914, 297,000,000 lbs. of foreign and 38,000,000 lbs. of domestic, against 146,000,000 lbs. and 32,000,000 lbs. for 1915. The bulk retained for consumption was thus 804,000,000 lbs. for 1913, 871,000,000 lbs. for 1914, and 1,001,000,000 lbs. for 1915. The woollen yarn exported during these three years weighed 55,000,000 lbs. (1913), 37,000,000 lbs. (1914), and 17,000,000 lbs. (1915); woollen piece goods exported measured 185,000,000 yards, 167,000,000 yards, and 160,000,000 yards. In millions of pounds sterling, the values of woollen exports of all kinds were 34·0 in 1913, 28·3 in 1914, and 31·1 in 1915.

Later statistics of the ordinary kind are wanting, and would be valueless and misleading, the trade in all its ramifications having been temporarily revolutionised by the war-time action of the Government in becoming first-purchaser and controller. Governmental requisition of British and Australian wools extended to their by-products, such as manufacturers' waste and shoddy. The authorities, after taking what they required, rationed all users *pro rata*, the hours of work being reduced to fifty per week. The prices of wool, both for their own requirements and for civilian purposes, were fixed by Government, which also fixed the prices for all their cloths, based on agreed conversion costs. All makers whose machinery was suitable became makers, more or less, for the British and Allied Governments. Standard cloths were selected for officers' wear, and prices fixed for maker, merchant, and maker-up. The abnormal conditions squeezed out the middleman—*i.e.*, the merchant or broker—and dislocated established activities, nearly every manufacturer making articles quite different from those of his normal output, and the civilian trade being very much out down.

For the purpose of incorporation in the present article the War Office furnished the following statement of quantities of the principal woollen goods purchased by it from August 4, 1914 to August 31, 1918, including purchases for Allied Governments. Cloth, woollen, 254,220,000 yards; flannel, 255,826,000 yards; blankets and rugs, 51,000,000; cap comforters, 18,730,000; drawers, woollen and flannel, 43,123,000 pairs; vests, woollen and flannel, 21,035,000; gloves, woollen, 19,871,000 pairs; socks, worsted, 150,371,000 pairs; jerseys and cardigans, 20,888,000.

During 1918 Government appropriation of machinery was continuously extended, very little being left for civilian trade.

THE LINEN INDUSTRY.

By W. H. WEBB, President Linen Merchants' Association.

THE botanical name of flax is "Linum Usitatissimum" (the most useful of fibres).

The first books of the Sacred Record contain frequent references to flax and linen, and all other textiles, with the exception of the products of wool, are babes in years as compared with linen.

Before Moses wrote the first books of the Sacred Volume, before even the Patriarch Abraham visited Pharaoh, the Egyptians had attained great perfection in the fabrication of linen.

The wonderful strength and durability of the mummy linen found to-day in the tombs of Egypt, and which must have been made at least 4,000 years ago, is striking proof of the outstanding qualities of this fibre.

The earliest record we have of linen being made in Ireland dates back to the thirteenth century, and it was probably introduced by the Norman settlers.

To-day in fabrics for military equipment requiring the greatest strength and durability, linen has again strikingly demonstrated its superiority.

After exhaustive experiments, linen was found, owing to its great strength and durability, to be the one satisfactory covering for the wings of aeroplanes, and every available loom in the north of Ireland is engaged in its manufacture.

For the paddings or linings of uniforms and for the thread used in the making of boots and uniforms, the demand has been unlimited, simply because it was found that linen would far outwear that made of any other fibre.

War, the great prover, has placed the superiority of linen in an unassailable position.

Linen possesses other unique properties of considerable value to mankind. Its "absorbency," which far exceeds that of any other fibre, makes it peculiarly suitable for the manufacture of towels.

The smoothness also of the fibre, which does not lend itself to the lodgment of germs, is the reason it is preferred for surgical dressings, and why it is also so desirable for damask table cloths and bed linen.

It is difficult to get definite figures for comparison in the linen industry, as in almost all available records flax, jute and hemp are grouped together.

Under this grouped heading the power looms in the United Kingdom in 1875 numbered 41,980, as against 54,440 in 1905, the distribution being:—

	<i>Ireland.</i>	<i>England & Wales.</i>	<i>Scotland.</i>
1875 ..	17,827	5,624	18,529
1905 ..	32,831	4,424	17,185

but for the reasons given these figures, as regards linen, are unreliable.

Little or no jute and hemp are manufactured in Ireland, as this is almost entirely confined to Scotland; therefore one would be safe in saying that by far the greater proportion of the linen produced in the United Kingdom comes from Belfast and district, where it is looked upon as the "staple industry."

The principal manufacturing centres in Scotland are Dundee and Dunfermline.

Broadly speaking, the heavier, coarser linen are made in Scotland, and the medium and finer varieties around Belfast.

Linen manufacturing can only be said to exist in England, a small section of the industry centring around Leeds, where about 600 operatives are employed.

Bleaching and finishing, both in Scotland and Ireland, is principally carried out in the country districts around the manufacturing centres, usually on the banks of some river, as a plentiful supply of water and a clean, pure atmosphere are essential for this operation.

Belfast is peculiarly well adapted to be the centre of the linen trade, as the immense shipyards give employment to the men, leaving a large surplus of women available for employment in the factories.

The total exports of linen goods, including flax yarns, from the United Kingdom in 1913 amounted in value to £9,400,000.

The raw material used in the linen industry is unfortunately not a home production, with the exception of the comparatively small amount grown in Ireland. Russia supplies the bulk, and other imports come from Holland and Belgium.

The Belgian or Courtrai flax is the finest in quality; Irish comes next; then the Dutch; Russia supplying all the coarser fibre.

To-day, however, the Allies depend entirely on the flax grown in Ireland for producing the aerocloth essential for the wing coverings of their aeroplanes, and the farmers, assisted by the higher prices, are rising to the occasion.

An attempt is being made to revive flax growing in England, an experimental station having been started at Selby in Yorkshire, with a view to handling the crop grown by farmers in the district.

The Linen industry, like many others, has suffered severely from the extreme individualism characteristic of our whole industrial system for many years.

The current is now, however, running strongly in the direction of co-operation, and it will emerge at the end of the war highly organised and ready for the bitter industrial struggle which is bound to follow.

The question of raw material is receiving attention, plans are well forward for carrying out important research work in connection with the industry, including a fully equipped laboratory in Belfast.

That all-important question of marketing has not been overlooked, and a comprehensive scheme for popularising and increasing the sale and distribution of Irish linen will be ready at the close of hostilities.

Owing to the shortage of raw material the Linen trade is now under a Control Board, with sub-committees in Scotland and Ireland.

The Industry is also co-operating with the Government in growing an additional acreage of flax in the United Kingdom, this project being handled by the Flax Society Limited, with headquarters in Belfast.

VELVETEEN AND CORDUROY INDUSTRY.

By J. HERBERT COOKE.

COTTON Velvet, often known as Velveteen, is a fabric with a very long history. It is believed that the Chinese made velvet from cotton as well as from other materials, at a date long anteceding the Christian Era. With other textile arts this one found its way across then highly civilized Asia, through Persia, Babylonia, Assyria and Palestine. The distribution and westward movements of these textile arts was hastened by the conquering Romans, and later by the great movements of the Crusades. Following these, the Italian Republics, developing the industrial arts, passed on the evolution of velvet through Venice and Genoa, the latter giving its name to a well-known weave, revived in cotton velvet in the nineteenth century. The Moors also in the industrialized Spain of their period were developing weft pile fabrics at Grenada.

Ecclesiastical adornment, and the climax of chivalry, carried velvet through France, Flanders and the Netherlands, whence the political and religious troubles of the sixteenth century forced many of the workers to the sheltering shores of England. That the material was in use in England of the Middle Ages is shown from reference to it in Shakespearian plays.

Fustian—a forerunner of velvet—was being produced in Manchester in the sixteenth century, but its great development took place in the nineteenth century, when the Manchester manufacturers began to imitate successfully the Lyons silk velvet. The ingenious methods of weaving the twill back, or Genoa velvets, producing a fast pile and soft draping effect, and the application of the fast dye—the invention of a Manchester firm of dyers—put cotton velvet into a foremost place for textile adornment in the markets of the world. The industry, sub-divided, specialized, and very technical in its various branches, is carried on in Lancashire and focussed in Manchester. High-class American cotton for the soft, silky weft, forming the pile, with fine Egyptian, strong and light, for the warp, combine to produce the double cloth which really forms velvet pile fabric. The grey material is produced in Oldham and Preston and at points in East Lancashire. Taking it from the grey stage, the Manchester merchants, whilst not actually manufacturing, arrange the various processes required to convert the material into the beautiful finished article so much admired in Regent Street or the Champs Elysees. The raising of the pile is a very interesting process, formerly a domestic industry, but now carried on in large mills, chiefly in the country districts of Cheshire. The work requires much dexterity, and consists in opening up the almost invisible longitudinal tunnels (called "races") into which cotton velvet is woven, by means of a very fine steel knife, sheathed in a long pointed guide. The function of this latter is to open out the tunnel so that the sharp blade of this fine knife may cut through the top of the tunnel and leave the walls standing. So fine are these "races" in the better qualities that they can only be picked up by the alert cutter, and are not visible to the naked eye. It has been the dream of many inventors to do this pile cutting by machinery, and many efforts have been made in this direction without success; but in recent years a very ingenious machine has been put into work which does perform the work well.

So complex, however, are the demands of the world markets in their varying degrees of fineness, that for this

reason the human hand and eye still hold the field for the bulk of this difficult work. When the pile has been produced the dresser has to manipulate it with brushes, shear it, singe it, and make a soft smooth surface for dyeing. Careful workmanship is required to produce the "fast dye" and the kindred operations of obtaining the lustre and the high degree of finish by the affinity of the silky grades of cotton employed. To meet the demand for cotton velvet from Paris to Peking, many textures and many grades are required. The Manchester merchant, as the virtual producer, has to have experience in all their varying requirements, and it is difficult to standardize qualities by reason of the diversity in quality, weight, price and style, and although the material is largely used in the home trade, probably some 80 per cent. of the production goes overseas.

A very important item in the industry is the "Ladies Corduroy," or corded velvet, eminently suitable for ladies' costumes. Many beautiful varieties of printed figured, striped and brocaded velvet are produced by the Manchester velvet merchant.

There is a growing trade in velvet ribbons, made from various grades of cotton velvet in the piece. Allied to the same industry is corduroy for men's wear, with its kindred fabric moleskin, both sometimes summarized under the old term "Fustian."

Corduroy is an article of great utility; rural Britain, the navy, the constructional gangs of North America, the South African farmer, the stockmen on the Australian plains, the French and Belgian peasants, all have found corduroy or moleskin fill a want not answered by any other fabric. The British and Allied War Departments have taken large quantities of corduroy from Manchester merchants during the war period, and have found it unequalled for wear and utility under trying circumstances.

In another field of usefulness corduroy is coming to the front for its designs and beautiful colourings as one of the high-class furnishing fabrics. Slippers of all grades have long been made of velveteen, and shoes, both for comfort and elegance, are being turned out in this utility material. In pre-war days the Germans were able to draw some of their raw material from grey manufacturers in this country, and by a subtle manipulation of their tariffs were able to dump the finished products in our home markets and at times in some of our Colonial markets.

It is understood that after-war legislation will render futile German efforts to destroy the Manchester manufacturers' legitimate trade in this way.

The various branches of the velvet industry have tended strongly to individualism in the past, but for the future co-operation, combined with research work, will be needed to strengthen the velvet industry in its grip of the world markets. With co-operation between the various sections of the trade it will be impossible for the wily Teuton ever again to acquire the influence which his policy of dividing the English interests has to some extent effected in the past.

Manchester manufacturers cater for the requirements of the world, and with a fair field can well continue the development of the trade which among them they have evolved, and in which many of them have been engaged for more than a century.

LEATHER INDUSTRY.

By Dr. J. GORDON PARKER,

Principal of the Leathersellers' Technical College.

THE manufacture or tanning of leather is in magnitude one of the most important industries of Great Britain, and at the same time one of the most ancient crafts.

The origin of tanning is lost in antiquity, but specimens of leather exist in our museums taken from the ancient temples and tombs of the Pharaohs, showing that good leather was manufactured, and even excellently dyed and finished, some 4,000 years B.C.

The art or craft of tanning, whilst not undergoing any radical change in the method of procedure, has made great headway during the last two or three decades, principally in the direction of hastening the process of tanning; and mechanical aids have been adopted with a view to increasing the rate of production with the minimum amount of labour. Whilst sole leather and the leather used for boots, belting, harness and saddlery, was formerly tanned with oak bark liquor, and the process took, according to the thickness of the skin, from twelve months to even two or three years, the vegetable tanning materials now employed have a much more rapid action.

One of the earliest form of tanning was the oil and smoke tannage, which consists of rubbing the skin with soft fat and afterwards exposing it to smoke produced by burning green wood, somewhat similar to the process still used by various Indian tribes.

Towards the middle of the nineteenth century other materials were introduced, notably myrabolams from India and valonia from Asia Minor, and these materials were blended with the oak bark in varying proportions. The addition of these resulted in the production of a firmer and better wearing leather of greater strength, and at the same time, because of the nature and strength of these materials, shortened the period of tanning.

In the early 'seventies a French patent was taken out for the extraction, concentration and decolorisation of tanning extracts, and there sprang up in France and Hungary factories where the oak and chestnut wood was extracted and the liquor concentrated in the form of extract containing upwards of 25 per cent. of tannic acid.

The introduction of these extracts had a marked effect upon the tanning industry, reducing the period of tannage and consequently cheapening the production of leather.

Other materials have since been introduced, such as mimosa bark from Australia and South Africa, and quebracho from the Argentine, sumach from Sicily.

Each of the various tanning materials possesses certain characteristics, and the art of tanning leather satisfactorily depends on the blend of the materials used. To-day, although oak bark is still used, practically 90 per cent. of the tanning materials are imported from various parts of the Empire.

Our tanneries are converting 170,000 hides per week into leather, of which number only about 50,000 per week are from our own native cattle. The others come largely from South America and within the Empire.

The industry has been able to produce leather for our own Army's requirements, and also has assisted in supplying our Allies with harness

and accoutrement leather, as well as some millions of pairs of boots.

LIGHT AND FANCY LEATHER.—The manufacture of leather from skins of sheep, goat and calf, as used in the fancy leather goods trade, has long been a specialised branch of the leather industry in which Great Britain excels. The tannage of these goods is, in the main, confined to the use of sumach—a tanning material imported from Sicily. This tanning agent is particularly suitable because of its very light colour, thereby enabling light and fancy shades to be dyed on the tanned leather, and because of its wearing properties and resistance to gas fumes. The British leather dyer has a reputation for the production of leather which has been coloured in "art" or fashionable shades. In the early days of the war, the production of this leather was considerably hampered by reason of the inability of dyers to obtain suitable colouring materials. During the past two years, very considerable relief has been experienced in this direction, with the consequence that almost every kind of fancy leather can now be manufactured dyed with dyes of British origin.

It is anticipated that the manufacture of fancy leather articles made entirely of components of British origin will continue to develop to a very considerable industry after the war.

CHROME TANNING.—As far back as 1881, the first patent was taken out for the production of mineral tanned leather by the chrome process. This method which consists in impregnating the fibres of the raw skin with chromic salts which are subsequently converted into chromic oxide, results in the production of a leather which, when properly manufactured, is superior in wearing properties to that which is vegetable tanned and possesses the additional property of being waterproof, of lighter weight, and when manufactured into boot upper leather, of smarter appearance.

Considerable improvements have been made since the original patent in the production of this leather, and great progress has been made in the manufacture, not only of boot upper leather, but also leather for war clothing, e.g., aviators' and motorists' coats, waistcoats, etc., during the past five years.

The process of chrome tanning is very rapid, it being possible to convert raw pelt into leather in as short a period of time as three or four hours, although a much longer time than this is given in actual practice.

Great progress has been made in the chrome tanning of heavy hides for sole leather; quite an appreciable percentage of sole leather is now tanned by this process; also hides are tanned chrome for picker bands, belting, and special mechanical leathers. British manufacturers were slow in taking full advantage of this newer process, and it was not until America and Germany had begun to export large quantities of chrome tanned leather to this country that the British manufacturers took up chrome tanning seriously.

There is no doubt that Great Britain possesses many advantages for the production of chrome upper leather, owing to the fact that large quantities of calfskins and kips are produced within the Empire, India alone producing twelve million kips per annum, besides immense quantities of goat and sheep skins.

BRITISH BRUSH-MAKING.

By T. MARSON TILL, Secretary of the British Brush Manufacturers' Association.

THERE is hardly a household, factory, workshop, or institution that exists where brushes of some kind or other are not used—yet few people seem to know how or of what brushes are made.

It is perhaps little known that the bristle used for brush-making throughout the world is grown on the semi-wild boar in Russia, China, and India.

Although bristle is the most important material used in the industry, brushes are also made from the hair of the horse, bear, goat, badger, squirrel, sable, and other animals—from fibre from the Mexican aloe tree—from piassava (bass), kitool, cocoa, and other fibres from various tropical palms.

The manufacture of brushes is divided roughly into five branches:—

1. Brushes "drawn" with wire or thread.
2. Painting and shaving brushes.
3. Brushes and brooms set with pitch, etc.
4. Twisted wire brushes for flues and boilers.
5. Ivory and bone hair and tooth brushes.

WIRE-DRAWN BRUSHES.

Include toilet, stable, and household brushes, such as scrubs and shoe brushes.

Tufts or knots of bristle or hair of double the length required are placed under loops of wire, which are passed through holes in the back of the brush and then drawn back with the bristle, thus bending them double and causing both ends to stand upright together. On the back of the stock is now glued and screwed a piece of decorative wood to cover up the wires and bent tufts showing through. The brush is then finished and polished.

Some of the commoner sorts of "drawn" brushes are made by plugging the "knots" with staples into the board by machinery, and this process has considerably developed during the war.

PAINTING AND SHAVING BRUSHES.

There are two classes of *painting brushes*—those for painters and decorators and those for artists.

Before painting and other bristle brushes can be made, the bristle, which is the most expensive part of the brush, has to be sorted and "dragged" into certain lengths from the raw bristle, washed, mixed, and tied into knots of required sizes and stiffness, so that the bend of all the bristles faces inwards, and the flags form concentric rings. The buying of suitable bristles and these operations require much skill and training.

The knots of bristles when so finished are concentric at the roots, and are bound on to the handle by string or wire, or are driven into a socket. A new process under which the roots are set in vulcanised rubber is being developed with success.

Artists' brushes are made from hair taken from the tail of the sable, marten, kolinsky, and squirrel, and also from bristles. They are set in quills of various sizes, or in metal. The work is chiefly done by girls. The firms in England who specialise in artists' brushes are few in number.

Shaving brushes.—The hair from along the middle of the back of the badger is the best hair from which these brushes are made. Goat hair

and bristles are also used and made to imitate badger, and unless the brush is stamped "badger hair" it may generally be taken that the brush is made of a mixture of hairs. The best badger hair is worth to-day about 300s. per lb.

BRUSHES AND BROOMS.

An entirely different process, known as "setting," is employed in the manufacture of these.

A knot of hair, fibre, or bristles is taken and the root end dipped into boiling pitch, bound with a thrum, then dipped again and inserted into a hole already bored in the wooden stock, a slight twist being given in the process to splay the hairs.

TWISTED WIRE BRUSHES FOR FLOES AND BOILERS.

These are chiefly made by special machinery.

IVORY AND BONE HAIR AND TOOTH BRUSHES.
This is a distinct branch of the trade, although most of the brushes come under the heading of "drawn" work.

Bone nail brushes are almost now entirely superseded by wooden ones.

Although the antiquity of the brush trade itself is not very great, the following early references to brushes are on record:—In the year 1377 A.D., "or wyped it (a coat) with a brussh." In the year 1519, "Olde men brushed theyr dustye clothes with cowe tayles: as we do with hear brusshes." The painting brush used by artists is probably the oldest type of brush. The few hair brushes that were made 120 years ago for the toilet were constructed on the principle upon which the modern broom is made—that is, the hairs were set in with pitch.

In the cheaper and commoner kinds of brushes foreign competition made some headway prior to the war, but in the better class of goods the British trade has always more than held its own.

Statistics give the following values of the trade:—

	Imports.	Exports.	Re-Exports.	Home Trade.
	£	£	£	£
1907	—	—	—	1,826,000
1913	456,141	237,312	22,157	—
1914	354,903	216,236	18,605	—
1915	377,573	187,162	14,107	—
1916	432,043	236,298	19,410	—
1917	90,287	213,898	8,144	—

In the year 1908 the British Brush Manufacturers' Association was formed, and now has a membership of some ninety leading manufacturers in the country.

The Scottish, Irish, and Northern Counties Brush Manufacturers' Associations, and Master Bone Brush Makers Association, representing about 97 manufacturers, are affiliated to the B.B.M.A.

The Association has standardised the stamping of brushes as to weight and material used, and has established the difference between bristles and hair—bristles now being strictly recognised in the trade as only the hair of the hog, pig, or boar.

The Government and Municipal bodies recognise the Association as representing the Trade, and much useful work has been done for the war and in other ways in co-operation with them.

GLASS BOTTLES.

By A. SIMPSON.

AS we know them to-day glass bottles are vastly different to those which were in use in the early ages. The earliest bottles were made from the skins of animals, but the ancient races also used bottles made of stone, ivory, alabaster, porcelain, and glass.

The actual origin of glass manufacture is somewhat obscure, but there is no doubt that the production of vessels to contain liquids, etc., was among the initial efforts of the pioneer glass-makers. The early glass bottles were not made by blowing in moulds as is the case to-day, but were formed upon a core of clay or sandy paste attached to a rod, which was dipped into the molten glass, the core being removed after the glass was cold. This method was used about 1400 B.C., and the use of the blowpipe was not adopted until considerably later. From reference to ancient records it appears that the manufacture of glass for domestic and industrial purposes began during the time of the Roman Empire, and at the dawn of the Christian era had been developed to an extraordinary extent.

The earliest reliable record of the manufacture of glass in Great Britain dates from 1230, when we find the industry established on the borders of Sussex and Surrey, but in Elizabeth's time it began to decline owing to the restrictions upon the use of timber as a fuel. About the year 1610 coal was first used as a fuel for glass furnaces, and the industry gradually expanded until in 1696 we find that there were eighty-eight glass factories in the country of which thirty-nine were classified as bottle factories. In 1746 the industry was in such a prosperous condition that the Government imposed an excise duty on glass manufacture, but this was of such an exorbitant nature that it considerably retarded its progress. In 1840 the production of glass bottles in Great Britain amounted to 525,574 cwts., of which 292,887 cwts. were exported, but in 1845 the tax was repealed, and from that time the industry has gradually grown to its present dimensions.

In making glass bottles by hand the larger varieties are generally made by a gang of five workers, known as a "chair" or "hole." The work performed by each member of the "hole" is as follows: the "gatherer" takes the molten glass from the furnace by means of an iron blowpipe and rolls it into shape on a slab of iron or stone. The "blower" takes the glass from the "gatherer" and places it in a mould and blows down the pipe until the bottle is the required shape. The "wetter-off" next detaches the bottle from the blowpipe with an iron tool called a "mullet." The "maker" finishes the neck of the bottle with a band of molten glass, which he shapes with a hand tool. The "taker-in" picks up each bottle as it is finished on a long rod and carries it to the annealing furnace

or "lehr," where it is cooled gradually. The "wetter-off" and "taker-in" are usually boys. In making small bottles the "hole" generally consists of four workers—two "blowers," a "maker," and a "taker-in." Sometimes, however, the "blower" has an apprentice who acts as "gatherer."

The introduction of machinery for making glass bottles undoubtedly marks the most important stage in the development of the industry. About the year 1876 a machine was designed in Australia, but was never developed. Soon afterwards Ashley designed a machine which was demonstrated in Yorkshire, but it was only partially successful. By this time many people interested in the manufacture of glass bottles in both Europe and America were giving the question serious thought, and a number of machines were exploited in quick succession. About sixteen years ago Owen designed a machine in U.S.A., which has since been improved. This machine is absolutely automatic, and the latest types are capable of producing twenty-four large bottles per minute. In 1915 another American invention, called the Hartford-Fairmont Feeder, became available to bottle manufacturers. This feeder delivers "gathers" of glass to various types of forming machines at a very high speed, and when used in conjunction with three semi-automatic bottle machines is reported to be capable of producing small narrow neck bottles at the rate of forty-five per minute. One feeder in combination with two or three semi-automatic forming machines becomes an absolutely automatic unit. Other notable machines are the Forster, Steele, Wilzin, Miller, O'Neill, and Cox.

British manufacturers of glass bottles have now a great opportunity to supply a larger portion of the world's demands, and those manufacturers who have equipped their works with the most efficient and up-to-date labour-saving devices will be in the best position to meet the vast requirements of the overseas markets.

The following statistics show the exports of glass bottles from the United Kingdom to all sources at intervals of ten years from 1853 to 1913:—

Year.	Quantity.	Value.
1853	457,787 cwts.	£248,458
1863	614,561 "	£312,686
1873	907,880 "	£461,918
1888	769,137 "	£356,496
1893	639,202 "	£305,781
1903	898,958 "	£443,782
1913	974,465 "	£605,847

Imports at intervals of ten years, from 1893 are as follows:—

Year.	Quantity.	Value.
1893	821,795 gross	£425,955
1903	1,831,665 "	£789,085
1913	1,923,571 "	£814,923

THE FUTURE OF THE BRITISH PIANO.

THESE notes are written at a time when the Central Powers appear to be rapidly tottering to their ultimate fall, and one may predict, without displaying undue optimism, that before they appear in print the world will once again know the blessings of peace. Peace, however, will bring a new set of problems for the British piano maker, and in no industry will the work of re-organisation present greater difficulties. The chief of these will be the question of raw materials. It is apparent that the rush for materials which inevitably will follow the cessation of hostilities can only be regulated by a continuation of the rationing system, priority being given to those industries which are deemed the most important to the national requirements.

Under these circumstances the piano maker is exercised in his mind as to the kind of consideration which will be given to his industry, for it has been the fashion in official circles during the last four years, to stigmatise the piano as a non-essential product. In putting forward his claims, the piano manufacturer does not quarrel with this view; the piano, however much it may administer to social amenities, cannot be described as an article of necessity, and he is willing to admit its comparative unimportance beside such vital matters as shipbuilding and re-housing, but what he does contend is that the British piano trade can become an important asset to the nation, providing it is permitted to avail itself of the opportunity presented by Germany's loss of goodwill. The German musical instrument industry has long had an elaborate mechanism for exploiting the world's markets, and it is not likely that the machinery will stand idle for long after the end of the war. The prejudice that exists against German goods in many of the chief markets is certainly a useful accessory to the British trader, but it cannot and will not prevail unless the British goods are forthcoming in quantities sufficient to meet the demand.

Before the war Germany had a hold upon the piano trade that will not be easy to upset, her exports in this class of goods being approximately £4,000,000, whilst that of Great Britain was £651,303, and even a large

proportion of the latter figure was represented by the re-export of German instruments. It is, therefore, apparent that the British manufacturer will need every advantage if he is to secure a share of the trade formerly done by Germany. Early supplies of raw material will assist towards this end, but more must be done if he is to compete upon equal terms with his former enemy. The German piano maker has enjoyed various advantages which have not been available to the British, and this is a matter which should engage the attention of the Board of Trade. Amongst these advantages may be mentioned special facilities in the purchase of imported materials destined to be converted into instruments for export, access to the most recent and comprehensive information affecting his trade in every country, and a special exclusive tariff for shipping goods to any part of the world.

As regards the home trade there should be a splendid future for British pianofortes if the public and the musical profession will only refuse to be hypnotised any longer by the legendary tone qualities of the German piano. It is not disputed that the better class German piano makers have succeeded in imparting a pleasing tone to their instruments, but there have always been a number of British makes fully equal in this respect to any German made instruments.

As a result of the slowness of the British public to realise this, and owing to the fact that no duty was payable upon imported instruments, Germany was able to sell annually to this country musical instruments to the value of no less than £900,000. From the bitter price competition which crippled the British home trade to the advantage of Germany there is likely to be relief, for musical instruments of foreign origin are now liable to a duty of 33½ per cent. and it is inconceivable that this valuable measure of protection will be relaxed after the war. As regards tone the buyer who will preserve an open mind, and test for himself the best known British makes, will find that the superiority of the German instrument in this respect is as complete a myth as the long-vaunted military infallibility of that nation.

Length;
4 ft. 10 ins.

Width;
4 ft. 10 ins.

The Weber Small Grand Piano

combines perfect tone with convenient size.

The Weber tone is the most perfect tone ever produced in a British made piano; it is surpassed by that of no other piano in the world.

And its distinctive loveliness, its richness, sonority, and liquidity are realized to the highest degree in the Weber Small Grand.

This instrument is an achievement in pianoforte making almost meriting the term revolutionary. For it is less than five feet in length—as convenient in size as an upright—yet nothing has been sacrificed in tonal quality.

And its exquisite proportions and lines stamp it as one of the most beautiful grands ever produced.

"ERINOID."

THE attention aroused by last year's article on "ERINOID," under the heading "A New British Industry," in which appeared a general description of the process of manufacture and a hint of its applications, has encouraged the belief that detailed particulars will be of interest.

The same title to-day, however, would be a misnomer; those concerned with this versatile material assert that it has cast its swaddling clothes, and, now well-known, has taken a unique place as a British manufacture which is an improvement upon, and a perfection of, an original German monopoly-product.

Australia, Canada, South Africa, India, France, Italy, Portugal, the United States, Japan, China, Holland, Spain—in fact, almost the entire civilised world, as we now know it—have tested and approved its qualities, and manufacturers everywhere are said to be preparing for the time when full supplies will be available for peace industries.

At present, a combination of exceptional electrical insulating properties and perfect working qualities has created a large demand for war service, and adequate provision cannot be made for other needs. It is not permitted to give in detail the various ways in which "ERINOID" assisted the Allies to crush German militarism and world lust, but it may be stated that it forms a very valuable component of all the modern machines of war on land and sea as well as in the air, and to some it has become essential.

Recent experiments made show the material to possess an insulating value far in excess of ordinary requirements, both as regards electrical resistance and breakdown voltage, and a reprint of a most exhaustive paper read by Mr. R. G. Allen, B.Sc.Lond., A.R.C.Sc.I., before the Royal Dublin Society, dealing with the results of his investigations of the insulating properties of "ERINOID," is very interesting and instructive reading.

Engineering firms have quickly availed themselves of this new British insulator, and are now using it largely in the manufacture of all kinds of Electrical Fittings and Accessories, including parts for Telegraph, Telephone and Wireless Installations, Aeroplanes, Motor Cars, as well as Magneto Terminals and Collector Rings, Levers, Switch Handles and Bases, Button Pushes, Insulated Plugs and Pegs, etc.

But " . . . Peace hath her victories
No less renown'd than war . . . "

and "ERINOID" has nothing to lose by the advent of Peace, as its adaptability for articles of general utility and ornament appears unlimited.

So far, existing conditions have not allowed the production of transparent material, since this requires an additional process involving the use of ingredients not now available, and this large field of additional usefulness still remains to be opened up when normal times return. Nor

has it been practicable to attempt to exhaust the possibilities as regards the fancy coloured and mottled forms of material, which also offers a wide range for future progress, covering some forty different shades, including realistic reproductions of Tortoiseshell, Buffalo Horn, Coral, Amber, Turquoise; this foreshadows a demand for the material for use in the manufacture of such articles as Beads, Brooches, Buckles, Buttons, Cigar and Cigarette Holders, Combs, Chessmen, Hair Prongs, Hat Pins, Labels, Paper Knives, Pencils and Penholders, Umbrella and Walking Stick Handles, Piano Keys, etc.

The appearance and finish of anything made from "ERINOID" cannot fail, on account of the brilliant polish, to please the connoisseur, who will also find the feature of non-inflammability an additional recommendation; while the economic production of all articles is assisted greatly by unique turning qualities and by the convenient forms of supply, which ensure the reduction to a minimum of waste in working.

One of the most remarkable features of "ERINOID" is that it will take a screw thread as fine and as sharp as brass or steel.

The forms of supply are:—

- (1) Rods—approximately 40 inches in length, ranging from 5 to 25 millimetres (1 inch) in diameter.
- (2) Tubes—of similar dimensions with a bore ranging from the thickness of a needle up to one-third of the total diameter.
- (3) Sheets—approximately 20 inches long, 16 inches wide, and ranging from 2 to 20 millimetres in thickness.

As some may harbour an impression that this new industry is using material which might be available for food, it should be stated that the Government Authorities have satisfied themselves that such is not the case.

Actually a real benefit has been conferred on farmers in remote districts and countries by the opening of a new market for their waste materials. Formerly, owing to lack of knowledge and means of preparation, the residues of milk frequently found their way into the streams, whereas now by simple scientific processes an important commercial use is provided for all its by-products.

Despite innumerable obstacles—some incidental to all industries, others peculiar to this in the shape of difficulties of supplies of raw material and special machinery—it is claimed that "Erinoid" has made great progress during the past four years, those connected with the Industry having combined courage with research (qualities now much needed for the development of all British Industries); the universal demand for its product for work of National importance should be conclusive evidence to all of the danger of ever again allowing the Germans to control the output of essential material of this kind.

All patriotic British manufacturers will be glad to know that they have on their doorstep a genuine British concern whose business is to supply at fair trade prices an improved and perfected material; if this programme is carried out it will save them from a forced reversion to German associations.

THE BISCUIT INDUSTRY.

By J. AUBREY REES, F.R.G.S.

BISCUIT-making is a modern industry. It is a far cry from Thearion, the Athenian baker, whose cakes and loaves were praised by Plato, to the half-a-dozen great firms among the British and Irish makers of biscuits. But as in other directions, so in this, it was reserved to the captains of industry such as Mr. George Palmer of Reading, the Carrs of Carlisle, the Peaks of London, the Jacobs of Dublin, and the Macfarlanes and McVities of Scotland, to create a modern biscuit, by the aid of continually improved machinery, to develop its kinds and sorts, and to present it to the consuming public at a price within the reach of the humblest in the land, and in literally bewildering variety.

The modern industry of biscuit-making arose about the year 1841, when flour and sugar began to get really cheap. The pioneers sent out their travellers with samples to call on the grocers' shops, and soon every grocer had added biscuits to his stock in trade. It was a new "line," and successors of to-day have no reason to regret the enterprise of their predecessors of sixty years ago.

The next step was for the British biscuit to attain world-wide fame, and for a vast export trade to arise. A huge fillip was given to this by the showing of biscuits at the Great Exhibition of 1851, and still greater extensions were the fruit of the exhibitions which were organised all over the world in subsequent years, notably the Great Paris Exhibition of 1878—when France had arisen proudly from the foul blows she received eight years earlier. In fact, to-day, there is no corner of the globe in which British biscuits may not be found, a delicacy beloved by every race and under every sky.

As for the variety of biscuits—their name is legion—from the hard, plain, lunch and cabin biscuit to the delicate wafer with its subtle flavour and aroma of vanilla or raspberry. All are the product of long years of experience, the finest of ingredients most carefully standardised, and the action of the most ingenious machinery. The output of one firm alone is enormous. It is, of course, impossible to indicate this adequately, but when it is said that it required ten years ago the equivalent of 62,000 loaded railway trucks yearly filled with raw material inwards and the finished products outwards, some idea of the vastness of the industry may be gained.

And makers have kept pace with our dietetic needs. At first it was a hard, tough

species of biscuit which found favour. Later the short-eating, crisp, thin variety—the kind which "melts in the mouth"—was introduced and rapidly made its way into the homes of a generation whose teeth, alas! are none of the best. Concurrently, the art of the confectioner has continuously evolved an endless stream of "fancy" kinds—short-bread, in which butter and sugar figure so largely, mixed kinds, in which almond-paste, coker-nut and flavouring essences are pressed into service, with dried fruits, etc., and biscuits which are more aptly described as "little cakes."

The production of ship or cabin biscuits at first sight is not so important an industry as in the old days of sailing ships with their long voyages: nowadays, apparatus for the making of fresh bread is found on almost every vessel; yet large quantities of this variety of biscuit are still made in the Navy Yards at Deptford, and by private firms, and taken to sea by way, at least, of precaution. One might also touch upon other varieties of biscuit, such as the various kinds made for dogs. This trade was largely in the hands of one well-known firm, which for many years has specialised in dog-biscuits, some quite plain, others with meat fibrine incorporated. There is also the charcoal biscuit, really a medicinal variety—black in colour, but of considerable benefit in certain kinds of digestive trouble.

Now, as might be expected, the world-war has had a great influence on biscuit-making. Very soon after the war-cloud burst the leading firms cut out many varieties they usually had in their price lists, and very soon also they turned their attention to making great quantities of biscuits for the Army and Navy, of a plain but wholesome kind. Then the regulations as to flour placed another severe handicap upon them, not to speak of the shortage of sugar and dried fruits, and the soaring prices of butter, eggs, milk and other essential ingredients. The day is not far distant when British biscuits will again go in increasing streams to every point of the compass. The industry but waits for the free flow inwards of raw material and the return of its operatives, the freeing of the seas and of the ships that go down to them, to develop enormously.

The British biscuit—shall we say the all-British biscuit?—will play a big part in the reconstruction of trade which is coming!

CONCENTRATED FOODS.

By FRANCIS FRENCH.

THE food question is one of outstanding importance nowadays and with a Ministry of Food to look after our daily bread (as well as our meat and other necessities) the amount of attention and publicity devoted to mere feeding would appear almost vulgar, were it not that the vital issues of the world hang upon it. Not many months ago it was a moot point as to whether the people of these Islands and the troops fighting for her great cause on foreign shores could be fed, but the submarine menace was faced with the traditional bravery by our seamen in the Mercantile Marine and our glorious Navy, and the gaunt spectre of want has been driven off, it is to be hoped never to return. A little consideration will show how fascinating is the subject, and the exercise of the faculty of imagination will indicate that in the outcome of the present struggle which is devastating the world the food question may be the decisive factor. The clash of arms, the locking of nations in a Titanic struggle, must all give way when the demand of an exhausted nature can no longer be neglected, and the side that can no longer be refreshed and restored must inevitably succumb. On the food question there is now the comforting reflection that Britain cannot lose, and there is a well-grounded feeling that the danger which beset us is, as far as human calculations can show, happily past.

With the fears of the past relieved, with supplies for the present secured, it is as interesting as it is necessary to consider what part food is to play in reconstruction after the War. It may be urged that it was not wholly to the discredit of the nation that it was not ready for war; no such consolatory euphemism will be permissible if we are not ready for peace and its problems. And one of the problems of peace—if not its greatest problem—will be the feeding of a hungry world. In a previous article on this subject it was stated that "the question of tonnage is one that looms large in the eyes of the whole world at the time that this is being written, and the saving of every inch of freight is being forced upon the nations, and here and now it is that concentrated foods have proved their value beyond question or doubt."

The problem of tonnage is no less acute than when the above was written and the advantages of concentration of foodstuffs into the smallest possible amount of space are no less apparent than important. And tonnage will be an equally difficult proposition in the days of reconstruction after the War. When it is considered that at the close of hostilities a very considerable proportion of the Continent of Europe will need to be rebuilt, and whilst the transition from the strenuous pursuit of war to the arts of peace is

being accomplished, it will be realised that the feeding of the peoples will continue to be a problem for some time to come. When foodstuffs have to be brought a great distance, and few of the European Powers will be able to provide for their own requirements for a long period, some form of concentration and preservation is necessary, if the food is to be available in a pure and fresh condition.

The concentration of food cannot be claimed as a British discovery; indeed, the origin of the compression of food for preserving purposes is lost in the mists of antiquity. In the days of the Pharaohs in Egypt it was customary to gather vegetables and preserve them by drying them either in the sun or in ovens, a custom that prevailed with little alteration until well on towards the middle of the nineteenth century, but the needs of the English and French soldiers in the Crimean War, when thousands of men died from disease due to the lack of vegetable food, led to the invention of a method of compressing dried vegetables into cakes or slabs of such small size that they actually succeeded in getting sufficient vegetables for one ration for 40,000 men into the space of one cubic yard. But British manufacturers in later years have been apt pupils, and to-day the preparation of compressed foods of all kinds can be justly claimed as a British Empire Industry employing an enormous number of hands and supplying the needs as well as adding to the amenities of the lives of the peoples of every part of the world. To the Arctic explorer as well as to the tropical traveller these foods have been an untold boon, whilst they have been equally helpful to the housekeeper, be she situated in the town or the most remote countryside. The making of soups might easily be a matter of time and patience, and even then the result possibly would be mediocrity and lack of variety. To-day the housekeeper can, through the enterprise of the British manufacturer, put on the table a different variety of soup every day for a fortnight at the expenditure of a very modest sum in money and an infinitesimal expenditure of time. What applies to soups applies to an infinite variety of other household necessities, which may be obtained in such variety and of such excellent quality as not only reflect credit upon the makers but do no injustice to the housewife. This question of quality and condition is one of importance, and which cannot be overestimated, and one which will have to be taken into account even more strictly in the future than in the past. The contamination of exposed foods is a matter which will have to be dealt with in the not distant future, and it is important to note that the concentrated and packed foods which are referred to are quite free from any risk of the character described. The British manufacturers may be depended upon to uphold their high reputation for quality and enterprise in the days that are before us, and in the matter of supplies of manufactured goods will do a not inconsiderable share when the time of reconstruction happily dawns.

Symington's Soups are nourishing and invigorating for body and nerves. Rich in strength-sustaining and energy-creating proteids they form an ideal food for mental and physical workers.

Symington's Soups are as welcome on hot days as on cold. They are tempting, appetising and stimulating, and can be prepared with the minimum of time, labour and expense.

SYMINGTON'S SOUPS

are made in British factories—they are pure, wholesome and economical. Every packet makes a quart of strengthening and savoury soup.

Tomato, Oxtail, Mulligatawny, Lentil, Kidney, Hare, Mock Turtle
Green Pea, Celery, Pea, Scotch Broth, Onion, White Vegetable.

Sold by all Grocers and Stores.

Manufactured by W. SYMINGTON & CO., LTD., Bowden Steam Mills,
Market Harborough.

CANNED, DRIED, AND SALTED VEGETABLES.

BRITISH ENTERPRISE.

By JOHN ARONDAL.

IF the importance of a new industry is measured by its relation to the life and well-being of the community, the preservation of vegetables should take a primary place among the industries of Great Britain.

Before the War we were content to depend for our needs on the Continent, whence enormous quantities were drawn, and we had the satisfaction of feeling that the British Navy and the British Army were largely fed from German sources.

EXPERIMENTS IN PRESERVATION.—The recognised dietetic value of vegetables, and the fact that large numbers of the population are beyond the reach of fresh vegetables, has led to many experiments in the direction of preserving vegetables on a large scale.

It is said that one Masson, head gardener to King Louis Phillipe, invented an improved process by which vegetables could be so dried by hot air as to retain all their flavour and good properties for several years and yet occupy only one-eighth of their original bulk. Nicholas Appert, another Frenchman, had already discovered the process of canning or bottling vegetables in hermetically sealed, sterilised receptacles, and the salting of vegetables, and packing of them in casks, has been a more rough-and-ready method of preserving them known for generations. "Julienne," a mixture of dried shreds of carrots, turnips, onions, cabbage, parsnips, leeks, lettuce, celery, etc., with a little sorrel and parsley, has been for the past half-century among the stock of all good-class grocers. This also was a French invention, taking its name from a Madame Deschamps, a market woman of Paris, who once supplied vegetables to the Tuileries, her mixture of herbs becoming popularly known by her own name. The latest phase was, of course, the exploiting by Germany of the manufacture of dried vegetables, whether in shred or powder form, and countless tons were bought in pre-war days by the British Admiralty and War Office, to say nothing of the Mercantile Marine, both from Germany and France.

BRITAIN WAKES UP.—With the outbreak of war the need for meeting our national requirements with British brains and British industry began to dawn upon the authorities—and others. A successful start was made at Evesham, and a factory is now working night and day to keep pace with the ever-increasing orders for home consumption and export. Quantities of all kinds of preserved vegetables, from penny packets of powdered beans, carrots, turnips, parsnips, and other varieties to tins and bottles of preserved

peas and casks of salted vegetables, are poured out daily, and so great is the demand that additional factories are multiplying throughout the country.

PROCESS INVOLVED.—A brief description of the processes involved in preservation may be given. For dried vegetables, shreds of powder, the prime fresh turnips, carrots, onions, cabbage, etc., are carefully sorted, washed, peeled and cut by a machine into strips and slightly steamed. They are then dried in iron cupboards by currents of hot air, each kind separately. This process fixes the saccharine and albuminous properties, prevents the waste of salts and essential oils, and in fact conserves all the invaluable dietetic qualities, with the loss only of the moisture, which, when the vegetables are required for use, is readily added again by soaking preliminary to cooking. If the vegetables are required to be in powder form they can be readily ground in their dried state. If in loose shreds ("Julienne") they are mixed in due proportions and packed in bags or cartons. If they are required compressed, this is done by means of hydraulic machinery.

For canned or bottled vegetables, the process is to sort and clean them and then pack them in the containers with cold water to cover them and a little salt, the covers being loosely fixed. They are then slowly heated in a strong brine or calcium chloride bath to 230° F., which temperature is maintained for a few minutes. The containers are allowed to cool before removal from the bath and the covers are either sealed with paraffin wax, or if tins, are finally soldered down. The essence of the process is first to kill all germs of decay by means of heat (sterilisation), and secondly to seal the container hermetically until the vegetables are required for use. Peas are perhaps the most familiar example of this method, and France, which has been *par excellence* the country of production, is now being outrivalled by England.

Now it is obvious that British brains and labour can as easily preserve all kinds of vegetables as British land can grow them. We need vast quantities now; we, and the world generally, will need them in the future. It is for British enterprise to take hold of the opportunity now offering. The Government is entirely favourable, we are assured, and the times are ripe for the huge development of a new home industry. This will no doubt involve the growing of immensely increased quantities of vegetables, but, as in other cases, this nation will, I have no doubt, rapidly attain the pre-eminent position it ought to occupy in this matter.

BRITISH WATCH AND CLOCK MAKING.

By ARTHUR TREMAYNE.

THE watch and clock making industries in England present all the features of a "horrible example" for the critic bemoaning British manufacturers' individualism and lack of enterprise. A close study of industrial history discloses Englishmen leading in mechanical production and educating the world in scientific research for at least two centuries, then, through their refusal to degrade manufacture by the use of immature methods or imperfect machines, and through official neglect almost equivalent to victimisation, losing prestige, while their production dwindled to such proportions that revival would seem to call for superhuman effort.

Not that England suffered from lack of craftsmen or lack of knowledge. She still employs more fully skilled watch-makers and produces more hand-made watches than any other country. English hand-made watches have served as models for other countries. The great watch-making industry of Switzerland arose from the accidental examination of an English watch by a genius, a farrier's apprentice, at Le Locle. The American branch of the industry which takes full credit for the inception and remarkable development of watch-making by machinery, became successful only when it copied English models with flattering faithfulness, and prospered only when it invaded the British market—to the grievous harm of the English makers, who have been slow to recognise that however excellent a hand-made watch may be, to make watches by hand is needlessly extravagant.

Lacking systematic records, without standards of practice, jealous of their handicraft, ignorant of the possibilities of machinery, scorning as degraded in quality anything produced in mass, the watch-makers of England persisted too long in their old slow methods, and lagged behind foreign makers.

The main reason was that no giant arose to give the industry a well timed lead. These old watch-makers, trained as no other mechanics, with their noses close to the bench, failed to see the wide vista of progress which the latter half of the nineteenth century opened to the world. Their successors of the twentieth century are rapidly turning the balance, having learned from their competitors as much as, or more than, these competitors had previously learned from England. At Coventry the industry flourishes on the most modern lines, neglecting no appliance or research which will improve output and quality. The seeming disability of conservatism prevented a headlong rush for cheapening, with the result that English watches have lost none of their high value and reputation.

Undoubtedly the present day English keyless lever watches, made throughout by machinery, equal the best foreign product of equivalent grade, and cost no more. The same may be said of clocks, which, having mechanism less microscopic than that of watches, and therefore lending themselves to manufacture by less highly skilled labour, will arrive earlier at full efficiency. Clock factories already equipped with clock-making machinery, utilised—at the moment of writing—for production on a great scale to meet war demands, will be prepared later to produce articles of British quality and reliability at keenly competitive prices.

Nor can the demand for these articles be small. The possession of accurate timekeepers—watches or clocks—is more than a national need: it is the very pivot of civilisation. Britain owes her Empire to her seamen, who won their early skill in seamanship by the excellence of their chronometers. Seamen depend for direction on the compass, and determine locality by the chronometer. The British Navy is the world's greatest buyer of chronometers and "hack" watches. Foreign naval and mercantile marine buyers seek after English chronometers in numbers far in excess of the normal rate of production. Besides this natural demand for a reliable article, the import duty of one-third on watches and clocks, although introduced as a war measure, acts already as an incentive for native manufacturers to forget their unhappy experiences as victims of studied dumping. If the duty is retained, as all interested in the trade desire it should be, English watch-making will advance with great strides to a commanding position, from which it will see and supply modern demands, however great.

The world's production runs into tens of millions of complete timekeepers every year, an enormous supply which does not mean a short average life for each, and frequent replacements, but a very consistent and spreading demand. When watches and clocks were expensive and rare luxuries for the few, they were far less reliable and durable than ordinary grade modern watches. To meet the modern demand, there are watches of grades and shapes suitable for every member of every civilised family, and clocks suitable for every room in every household. The demand for public clocks, and for recording clocks for timekeeping and costing systems in factories, increases daily. All of these demands will be met by British goods of high standard. All buyers, in all the world's markets, will find it much to their advantage to obtain samples from the leading manufacturers. They will have no cause to complain of the Briton's lack of enterprise.

GREENWICH OBSERVATORY

ASTRAL

This Registered Trade Mark on Watches and Clocks guarantees a sound reliable ENGLISH product manufactured throughout at Coventry by H. Williamson, Ltd. Enquiries are invited from Colonial and Foreign buyers. Favourable terms are given for important manufacturing contracts.

English Watches

The Coventry ASTRAL English Lever machine-made Watch is a high-grade certificated timekeeper at a popular price. The movement embodies all the most recent and valuable horological improvements and is cased in styles

OF EVERY DESCRIPTION.

It is essentially a watch for general wear and meets with a ready sale. It is accurately adjusted, but is not of delicate construction. Each movement is tested and given a certificate of rate. Kew certificates furnished if desired.

English Clocks

The new range of Coventry ASTRAL English Clocks shortly to be placed on the market will cover all styles of Domestic and Dial Clocks of high quality. The movements will be for

TIME, CHIME, AND STRIKE,

cased in a countless number of styles. A special feature will be made of cases designed as faithful reproductions and adaptations of Antique and Classic models to suit the prevailing tastes in all markets.

ART, PROGRESS, AND THE GRAMOPHONE.

By G. IVY SANDERS

(the well-known contributor to the "Daily Mail," and Editor of "The Voice").

THE new uses of the modern gramophone are infinite. During the war it became as essential a feature of the equipment of a hospital as a band to a regiment. This magic box of music brought life and joy to the men in the lonely lightships and lighthouses around our coasts, to our seamen in the tiny drifters, to the ward-rooms and lower decks of battleships, and to the heroes of the wave-smothered and speed-shaken destroyers of the Atlantic. Deep down in the sea the submarine crews forgot their danger and solitude in the mellifluous and melodious voice of the gramophone. In every land our soldiers in the recreation huts, mess rooms, aerodromes and dug-outs, in Indian camps, in Egyptian oases, in African forests, and on Mesopotamian rivers, were soothed, cheered, made happy and gay by the newest artistic triumphs of the gramophone.

But this perfect piece of mechanism did not arise in a night. Twenty years ago the crude little talking machine, with its cylindrical records, without springs or sound box, was worked by hand, like a coffee mill.

The first striking improvement effected was the introduction of flat portable discs in the place of clumsy and fragile cylinders. This brought about a double benefit—the disappearance of the old unpleasant nasal sound, and the fact that a hundred disc records can be packed into the space of a dozen of the breakable cylinders. The vibrations, too, are recorded on the *side* of the tiny groove of the record instead of the *bottom*—the raucous "hill and dale" system as it is called.

The absence of a speed regulator in the hand-turned machine was the source of most of the discord which prevented the proper progress of the music machines of that time.

Fortunately there came one of those episodic developments which began to put the gramophone where it is to-day in the affections of every home circle. Alfred Clark gave the world, in 1897, a simple speed-regulating device which, for the first time, afforded consistent rhythm to the turn-table, no matter how irregularly the player might turn the handle. By this clever improvement evenness of time and of tone was secured.

Two other inventions were at that time on their way. One was the beautiful little sound box, to which the accuracy, delicacy and sweetness of the modern gramophone are due, it resulted from the brain collaboration of Alfred Clark and Eldridge R. Johnson. From that time no practical result has been obtained from any sound box deviating from the fundamental principle laid down in the Clark and Johnson patents of that early date.

The other basic invention due to Eldridge Johnson was the development of a spring motor as applied to the gramophone. By 1898 the hand-driven machine with its little speed regulator was replaced by a well-balanced clock-work motor. From the brains of men of genius and scientific pre-eminence there flowed continuously revolutionary improvements in recording; the invention of the tapered metal tone arm; and the enclosed horn, or so-called hornless machine, so popular to-day.

Concurrently with this progress the musical potentialities have been immensely developed, until, in 1919, there is now no kind of music which cannot be placed on record and reproduced with absolute perfection.

The gramophone has unique educational values. Often in America school children march and drill to music rendered by the gramophone. The art of elocution and foreign languages could be more easily taught by carefully selected records of an expert in the particular subject, than by forcing the students to labour under the often faulty accent of a local teacher. The talking machine has already proven its usefulness in numerous business houses in England and America.

By the evolution of the gramophone, a charm has been added to home life greater than any in the history of domestic recreation and enjoyment.

The gramophone was one of the outstanding features of the strange and never-to-be-forgotten life in the war zone. Indeed, during the war, it was stated in the Press by a high officer of the R.F.A. that "*it would have been impossible to find one spot along the whole of the British Front out of the range of the sound of the gramophone.*"

THE TYPEWRITER.

PEACE hath her victories no less renowned than war. It has also been said that the pen is mightier than the sword. Whatever the pen can write (excepting music), the typewriter can print. What the sewing machine is to the home the typewriter is to the office. As an idea, the typewriter is no new thing, though comparatively new as the basis of a successful industry. The earliest record of its conception occurs in a patent granted to an Englishman, Henry Mill, in 1714. (The specification gives no mechanical details.) No further efforts seem to have been made until 1784, but from that year onwards numerous attempts to construct a practical writing machine are on record. The most notable achievements were the following. In 1840 two British inventors, Bain and Wright, patented a typewriter-telegraph, in which the vital principle of the typebar circle was first used. In 1843 an American, Thurber, constructed the first machine embodying the step-by-step lateral movement of the paper-platen. In 1867, the *Scientific American* described a writing machine recently invented by John Pratt, an American living at Camden Town; and this description caught the eyes of two American printers, Sholes and Soule, who were busy with the invention of a machine for serially numbering book pages. Thence they got the idea of extending its scope to cover the alphabet, as well as the figure range. For six years Sholes persevered, and eventually succeeded in making a model good enough to interest a well-known firm of gun-makers in its commercial possibilities. In 1874, the first crude but capable machines were marketed. That was the beginning of the typewriter industry. It was not, however, until after 1880 that its success was assured. Of the world's annual output of typewriters, roughly estimated at 500,000 machines, the United States, with its population of nearly 100,000,000, absorbs about 250,000. Great Britain so far has only required some 50,000 machines a year, not including the re-export and export trade. The multifarious work caused by the war created an enormous demand for typewriters. The war changed the situation of nearly every office in the kingdom. All managers were confronted with a large amount of clerical labour, with a sadly depleted and often inexperienced staff to do it. Many found refuge in typewriters who ought to have used them before, and were willing to pay double pre-war prices. In 1917 importation of typewriters was prohibited, and demand forced up value of second-hand re-built machines to fancy prices. In addition to the typewriter every device that would save time, labour, and expense was tried, consequently British offices are better equipped than ever they were. Few people realise to what an extent mechanism can replace or expedite clerical work. Hitherto the manufacture of typewriters in England has not reached the volume that it should. This applies unfortunately to many other trades. As a result of the war, now so happily ended, public interest is awake at last to the necessity of supporting home manufactures. Probably the high cost of machines prevented the use on a larger scale. The great American concerns run their business

in such a costly manner that about 50 per cent. of the price has had to be set aside for selling expenses. The high prices thus charged are therefore out of all proportion to the manufacturing cost; one of the largest corporations altered their methods, and brought out a machine at half the price of their standard one, which course is stated to have yielded satisfactory results. This shows that a good machine can be produced at a popular price, and justifies the expectation that a much larger output of home-made machines will soon be recorded. All people will have to produce more after the war than they did before; if this result can be obtained by working at harder pressure for a shortened day, so much the better, especially from a national health standpoint. This can only be done by the aid of suitable machinery. As a labour-saving instrument, which lessens fatigue and eye-strain, the modern typewriter should be indispensable in every well-found office. The position of the typewriter has, of course, long since been assured. At first it was difficult to sell the machine because the world did not recognize the enormous value of legibility, uniformity, and speed, in its output. To-day, these points are appreciated. Even now, however, the demand for the typewriter has not nearly reached its limits. In their own interests many more people ought to use the typewriter, and many business firms ought to use more machines. Many professional and commercial documents are still, unjustifiably, pen-written. The typewriter has recently been developed in a new direction, mechanism having been adapted to it which makes it an adding and subtracting machine, while it remains also a writing machine. The convenience of having at hand an instrument that will perform all these functions will be readily appreciated in the counting house. In view of all the different nationalities in the great war for freedom, one feature claims passing notice. Typewriters equipped with a plain type carrier for general correspondence can also be fitted with separate type carriers for any foreign languages, or for medical, astronomical, or other technical symbols, the change being effected in a few seconds. There are about ninety different kinds of typewriters made in the world. "*Made in Germany*" must for years be a term of reproach, memorising cut-throat competition and peaceful penetration, leading up to a pre-arranged war. "*Made in England*" must be the hallmark demanded, whenever possible, by every patriotic purchaser; this will economise in our diminished but ever glorious mercantile marine the precious cargo space so urgently needed for food and raw materials. The promotion and establishment of British industries is an important national duty; their protection and support will be the Empire's best thanksgiving charter to the millions of her sons and daughters who so lavishly gave their services. There cannot be a nobler way of commemorating a victorious peace than by ensuring to every man and to every woman ample work and adequate remuneration in the homelands they helped to save.

The IMPERIAL TYPEWRITER

ESTABLISHED at Leicester in 1902 and incorporated in 1908, the manufacturers of the Imperial Typewriter own and operate in 1919 the largest and best equipped writing machine plant in the British Empire and enjoy a large and constantly increasing home and export trade.

THE IMPERIAL TYPEWRITER has gained its world-wide popularity because of its adaptability; the changeable type feature, whereby not only the type, but the keyboard also, is changed from one language or style of type to another in four seconds, gives this machine a wider field of usefulness than is found in other typewriters.

Although smaller in size, lighter in weight and lower in price, the IMPERIAL possesses a work-capacity equal to any of the larger and more costly machines. It is, in addition, famous for its great durability, power and high speed. Fuller particulars on request. Address :—

IMPERIAL TYPEWRITER CO., Ltd., Leicester, Eng.

THE BRITISH PENCIL INDUSTRY.

By G. H. MEADMORE.

THE manufacture of lead pencils in similar form to the familiar article of to-day dates from a period immediately following the discovery of the once famous Borrowdale mine, situated a few miles from Keswick, in Cumberland, in the year 1564. At a much earlier period metallic lead was used for marking on parchment, paper or other material, and it is doubtless owing to the earlier use of this substance that the erroneous term "black lead" has been applied to plumbago or graphite.

The history of the lead pencil for nearly three centuries is closely associated with the fortunes of this mine, and it is probable that in no other part of the world has similar graphite been found equal to that found there. Analyses, however, which have been taken of the Borrowdale graphite show that it was not of exceptional purity, but it was the physical condition in which it occurred that gave it its value for pencils. The product was so greatly desired, and was so closely maintained as a monopoly, that, in pursuance of an Act of Parliament, the mouth of the mine was guarded by an armed force, and to maintain the monopoly and conserve the supply, the mine was only worked during six weeks in each year. To prevent pilfering, the mine was closed by flooding. The graphite was sold by public auction in London, and for many years the Cumberland mines were probably the only source of supply for pencil making. The graphite was used in its natural state, being cut or sawn into rectangular sticks and enclosed in their wooden casing. This method was not economic, and towards the close of the 18th century, when the deposits began to show signs of exhaustion, and also during the early part of the 19th century, efforts were made to discover a means by which the waste which had accumulated in the factories and the residue from the mine could be utilised. Pulverisation, with the addition of a binding medium such as glue, isinglass, or gum, was tried, but without marked success, and was eventually abandoned in favour of the process originated by Conté, a French chemist, in 1795. By this process finely-ground graphite is mixed with clay, formed into strips, and baked. This invention marks the most important step in the manufacture of the modern pencil, and is the process now in universal use.

Graphite, of which there are two distinct types, viz., foliate or crystalline, and compact or amorphous, has since been found in many parts of the world, but that mostly used by the pencil manufacturer comes from Mexico. Foliate graphite is difficult to grind to the required fineness, and is less brilliant in colour than the amorphous, which, on the other hand, can be ground to a gritless fineness, and is of a nature which combines readily with other materials.

The manufacture of the modern pencil requires considerable technical knowledge, and involves a large number of operations. The graphite, which has already been prepared at the mines, is mixed with clay in a dry state,

then moistened and milled to the requisite fineness. Filter presses free the "batch" from an excess of moisture, and it then passes through a series of compressors, from the last of which it is extruded through a hole or holes slightly larger than the actual thickness required, to allow for shrinkage, and the "strip" is thus formed. At this stage it is in plastic form. It is laid out in trays, in lengths of about 22 inches, and after drying is ready for baking. The degrees of hardness are primarily obtained by varying the proportions of clay and graphite.

Nearly all pencils are made of cedar wood, which, owing to its softness, straight grain, and freedom from knots, make it peculiarly adapted for this purpose. The red cedar, or pencil cedar, belongs to the juniper family, being the *Juniperus virginiana*, which is found at its best in the south-eastern States of the U.S.A. The wood is mainly imported in the form of "slats," i.e., strips about $7\frac{1}{2}$ ins. long, $\frac{1}{8}$ ins. thick, and from 2 ply to 6 ply in width, 6 ply being the width of 6 pencils. The slats are grooved, coated with glue, and the lead strips inserted. Two slats, one of which contains the strips, are glued together, and the blocks thus formed are fed into the shaping machine. This machine cuts a series of semicircular grooves on each side of the blocks, converting them into shaped pencils. The pencils have then to be sand-papered, coloured and polished, the ends cleaned, and finally stamped and bronzed.

The raw materials employed in the manufacture of coloured pencils are clay, wax, and a colouring agent, but the clay is of a softer nature than that required for black pencils. Bohemian clay, having this requisite property, has in the past been greatly favoured for this purpose. Clay eminently suitable for the purpose exists, however, in the United Kingdom, and British aniline dye suitable for the production of copying ink pencils is now obtainable. Owing to careful research work the technical difficulties in regard to the manufacture of coloured "strip" have now been surmounted, and to-day British copying ink and coloured pencils, of high grade, including dermatograph pencils for surgical purposes, and pencils for marking on china and glass are being produced.

The Pencil and Colour Industries are closely allied, the pencil manufacturer being dependent on the colour manufacturer for colours, often specially produced, and it is this connection which has largely contributed towards the pencil industry being so successful in Germany.

It is obvious that with this serious handicap the British pencil manufacturer must have been well equipped in other respects, and a comparison between British and Austro-German products would show that where any difference exists in favour of the Foreign production it is primarily the finish due to colour.

Production in this industry as in many others has been limited under war conditions, but when raw materials can again be freely imported, and with the help of the British Colour Industry, now being established, there is no reason why pencil making in the United Kingdom should not expand into an extensive industry.

BUSINESS ESTABLISHED IN 1803.

18 PRIZE MEDALS AWARDED FOR EXCELLENCE OF QUALITY.

NO Pencil Factory in the world is better equipped for producing Black Lead and Coloured Pencils of all qualities and degrees.

PAPER TRADE INDUSTRY.

By H. P. STEVENS, M.A., F.I.C.

RAW MATERIALS.—The raw materials used in the British Isles for the manufacture of paper consist of (1) vegetable fibres, derived chiefly from wood, esparto, rags and straw; recently even sawdust has been utilised; (2) soda, lime and bleaching powder for the purification of the fibres; (3) rosin, glue, gelatine and starch for sizing and giving a finish to the paper; (4) loading materials such as china clay, chalk, gypsum, etc., to cheapen and render the paper opaque; (5) colours such as ultramarine, coal-tar dyes, the former being used chiefly to counteract the natural yellow tinge in the manufacture of white papers; and (6) waste papers. The manufacture of paper also requires coal for steam raising and a very ample supply of good water.

Rags, which once supplied the bulk of the paper-makers' raw material, are now used for high-grade papers only, and Great Britain is dependent on its Colonies and on foreign countries for the supply of the great bulk of vegetable fibres. Of these wood pulp is the most important. In normal times this comprises four-fifths of the amount of our imports of fibrous materials.

Wood pulp is of two varieties—"mechanical" wood pulp and "chemical" wood pulp. The former predominates and consists of wood ground to pulp in a stream of water; the latter consists of wood disintegrated by chemical processes and fetches two or three times as much as the mechanical pulp. The wood used is mostly coniferous (spruce, fir) and therefore derived from countries with temperate or cold climates. Norway and Sweden supplied the bulk of our requirements, next in importance were Russia (Finland), Canada, Newfoundland and Germany. The cutting off of supplies from the last-named country has not appreciably affected the position, and until the restrictive measures came into operation, the British imports of wood pulp had increased rather than diminished. There are ample reserves of wood in Canada and Newfoundland to supply all British requirements.

Esparto is imported in the raw state and converted into pulp in English mills. It is mostly derived from Algeria, the remainder from Spain and parts of the North Coast of Africa. Owing to the war, imports have dropped to a fraction of their original amount.

Rags are largely imported, but the war has reduced the import to one-third of the pre-war figure.

The following figures give the imports of fibrous raw materials for the three years 1915, 1916 and 1917:—

Description	1915 Tons.	1916 Tons.	1917 Tons.
Mechanical Wood Pulp ..	551,209	459,317	215,750
Chemical Wood Pulp ..	402,841	198,765	171,741
Esparto	137,538	148,851	56,976
Rags	11,130	4,776	2,132
Other Materials	3,634	1,417	139
Totals	1,106,361	813,125	446,138

Of other raw materials the most noticeable feature is the falling off in imports of bleaching powder.

IMPORTS AND EXPORTS OF PAPER.—For our purpose the term "paper" must be held to include not only printing, writing and wrapping papers, but also paste board, cardboard, mill board, straw boards, and many specialities.

As regards imports Norway and Sweden supply us with the greater part of the cheaper kinds, such as news and wrapping papers, while Germany's exports of paper to this country were of equal importance, for, although cheap printings, such as newspaper, did not bulk so largely, this was neutralized by the larger quantities of almost every other type. The cutting off of the German supplies has not caused us much inconvenience except in the case of some special types, such as vegetable parchment, photographic, grease-proof, and filter papers. Stops have been taken to increase the home supply, which in some cases is already adequate.

The following figures give the quantity and value of the British imports of paper and boards during the last three years:—

IMPORTS.					
1915	1916	1917	1915	1916	1917
Tons.	Tons.	Tons.	£	£	£
586,000	469,000	14,000	6,648,665	8,327,405	4,190,312

Over one quarter of these quantities used to be accounted for by strawboards manufactured in countries where straw is plentiful. Great Britain is estimated to produce about 11 per cent. of the world's output of paper and Canada 3 per cent. The United States is by far the largest producer, manufacturing over one-third, and was followed in order by Germany, England, France, Austria, Canada, Italy, Russia, Finland, etc. The British exports of paper for the last three years are given in the following table:—

EXPORTS.					
1915	1916	1917	1915	1916	1917
Tons.	Tons.	Tons.	£	£	£
137,965	128,000	45,800	2,997,053	5,195,187	3,195,014

MANUFACTURE OF PAPER IN THE BRITISH ISLES.—There are 231 paper and cardboard mills in England, sixty-one in Scotland and seven in Ireland. Wood pulp is only manufactured at two mills. There are thirty-seven paper mills in Canada and a large number of wood pulp mills. Some Canadian mills combine the manufacture of both wood pulp and paper. In Newfoundland there are two large establishments, one producing wood pulp and paper and the other wood pulp only. There are seven paper mills in Australia, three in New Zealand and eight in India. Official statistics of the paper output in Great Britain and Ireland were furnished in 1907 for the Census of Production:—

Paper:—	United Kingdom. Quantity.	Value.
Paper for Writing and Drawing and for Envelopes	124,250	3,065,000
Paper for Printing and for Posters, etc. Packing and Wrapping Paper, Bis- cuits, etc.	436,050	5,590,000
Printing and Coated Papers (not hangings)	181,850	1,943,000
Pasteboard, Cardboard and Millboard Other Sorts	34,050	846,000
Paper Bags	44,450	565,000
	28,200	700,000
	55,500	487,000
	884,550	

All other Products—Recorded by Value only	112,000
Total Value	13,328,000

A more recent but unofficial estimate has been kindly supplied me by the Paper Makers' Association. The following figures give the annual pre-war production of paper manufactured in the British Isles:—

	Tons.
News, all grades	377,000
Printing and Writing Paper from Wood Pulp ..	254,800
Printing, mostly from Grass (Esparto)	143,200
Brown Papers and Specialities	228,800
Best Writings and Blottings, mostly from Rags	20,800
	1,029,600

BAILEY'S ELASTIC STOCKINGS

A badly fitting Stocking, or one made of unsuitable material, is not only no good—it is positively harmful.

BAILEY'S PATENT BELTS.

Write for Booklets.

'BAILEY'S "VERILITE" TRUSS.

A perfect Truss. Effective without restraint. Acts simply as a clip, and adapts itself to every movement of the body.

BAILEY'S HYGIENIC WASHABLE TRUSSES.

They are covered in a strong, flexible, and very durable enamel, which will last for years, and are therefore especially suitable for the bath, for travellers, for sea voyages, and the tropics. There is nothing to wear out as in the ordinary leather-covered trusses, and they are unaffected by moisture or perspiration.

EDUCATION.**MESSRS. GABBITAS, THRING & CO.,****38, Sackville Street, Piccadilly, W.,**Tel. 4926
Regent.

have a Department specially organised for advising Parents and Guardians as to the best Educational Establishments for Boys and Girls in the United Kingdom or on the Continent. The Firm have had experience as Educational Agents for forty years, and during their long career have been instrumental in sending Masters and Tutors to the leading Schools and Tutors' Establishments, and are in the closest touch with all educational matters. They can give, FREE OF CHARGE, to the Parent or Guardian information and advice as to—

SCHOOLS FOR BOYS OR GIRLS. TUTORS'
ESTABLISHMENTS. EDUCATIONAL HOMES.
DOMESTIC ECONOMY, AGRICULTURAL, AND
SECRETARIAL COLLEGES.

EITHER AT HOME
OR
ABROAD.

To enable the Firm to advise efficiently it is necessary that *full particulars should be given*; especially as to the age of the Pupil, previous education, and present standard of attainments, special subjects of study, locality, whether a large or small establishment is preferred, and the fees it is intended to pay.

The Firm also can assist in procuring the services of Private Tutors and Governesses, Resident, Travelling, Non-Resident, or Visiting, of whom they always have a large number on their Lists.

Transfers of and Partnerships in Boys' and Girls' Schools are also negotiated. Masters, Tutors, and Governesses seeking Posts can have a Prospectus on application, free of charge.

WHITAKER'S LIST OF SCHOOLS AND CLIMATES

Health and moral training matters of supreme importance.

Physical Exercises, Drill, Cricket, Football and Tennis.

Fees.—15 to 18 guineas per term.

EASTBOURNE.

The Medical Officer of Health writes:—"Its advantages as a health resort are much sunshine, clean, quickly-drying roadways, large parks and gardens with many trees, a plentiful and good water-supply from wells sunk in the deep chalk, and the proximity to the breezy, health-giving South Downs. The climate is beneficial for convalescents and in anemia, scrofula, and early tubercular disease; excellent for children. Full benefit of winter sun is secured. Always at or near the top for sunshine in official records."

Situated on the coast between Brighton and Hastings, on the eastern slopes of Beachy Head, which rises 550 feet above the sea, and shelters the town, Eastbourne has developed, under the fostering influence of the Devonshire and Gilbert families, into a fashionable watering-place (select but not dull); a residential town (within one and a half hours from London by express train); and an important educational centre. The sea-front extends for a distance of three miles, without a single shop.

BOYS. ST. BEDES. PREPARATORY SCHOOL FOR THE PUBLIC SCHOOLS AND ROYAL NAVY.

Headmaster - G. H. GOWRING, M.A.
New Buildings situated in a sunny and commanding position, protected on the S.W. by Beachy Head. Curriculum includes Swedish Physical Drill and Gymnastic Instruction. A War Office Miniature Rifle Range of 100 yds. on the Playing Field at the School.

Close to Sea, healthiest part. *Playing Field.*—Tennis, Cricket, &c. Gymnasium, Riding, Swimming, Cycling.

HUNSTANTON-ON-SEA.

The Medical Officer of Health writes:—"Hunstanton shares with all the East Coast watering-places a great reputation for convalescents. Apart from this, Hunstanton seems specially adapted for children. The rapidly-drying soil, the absolutely safe bathing, the magnificent sands for exercise in wet or dry weather, perfect drainage, and splendid water, combine to make it an ideal place for them. The number of schools and the wonderful physical progress of weakly children bear testimony to these advantages."

This quiet East Coast health resort stands on the north-west coast of Norfolk, facing the Wash, between Cromer and King's Lynn. Pier. 800 feet in length. Golf Links, 18 holes. Pop. 2,511. G.E. Ry.

BOYS. THE GLEBE HOUSE.

Principals - The Misses ROBERTSHAW.

NEWPORT, SALOP.

L. & N.W. Rly., 17 m. from Shrewsbury. The climate of Newport is dry, the average rainfall being 24 inches per annum. The soil is sandstone, and the water-supply excellent.

**HARPER ADAMS
AGRICULTURAL
COLLEGE.**

Principal—P. HEDWORTH FOULKES,
B.Sc. (Edm.), F.E.S., M.R.A.S.E.

College buildings and grounds cover an area of about 6 acres, situate 250 feet above sea-level, in open but well-wooded country. Large Lecture Rooms, Biological and Chemical Laboratories, Museum, etc. Electric Light, Modern Sanitation. Farm, 300 acres. Instruction given in the form of Lectures. Demonstrations and Practical Work. Field Experimental Work. Dairy, Poultry, and Horticultural Departments. Engineer's, Blacksmith's, and Carpenter's Shops. Courses open to Men and Women.

Fees.—From 60 guineas per Session.

MALVERN

(Worcester). The Medical Officer of Health writes:—"Malvern is picturesquely situated on the eastern and western slopes of the range of Malvern Hills, with extensive and magnificent views on both sides. The hills, which rise to an altitude of 1,400 feet, are easily accessible for delicate persons, either on foot or by carriage. The climate has a most beneficial effect on invalids. The houses are so placed as to receive more than the ordinary amount of sunshine. Weakly children, especially those suffering from tubercular glands or continually recurring catarrhs, in nearly all cases do remarkably well here. The rainfall is low, and the soil dries with remarkable rapidity. The water-supply is bountiful and of great purity, and the sanitary state of the district generally of a high standard. The average annual death-rate is 10·5 per 1,000 of the population. Outbreaks of infectious diseases are few and quickly suppressed, as the Urban Council are provided with every means for promptly dealing with any case that may arise."

BOYS.

THE SCHOOL, MALVERN LINK.

W. DOUGLAS (Scholar, Keble College, Oxford),
Five years Assistant Master at Rossall.

Boys prepared for PUBLIC SCHOOLS and NAVY.

House faces South, with large Playground, Carpenter's Shop, Fives Court, Boys' Gardens, Swimming Bath, adjoining house.

SEAFORD.

The Medical Officer of Health writes:—"Pop. 5,358. On the Sussex coast, 58 m. from London, between Brighton and Eastbourne. L.B. & S.C. Rly. Climate of Seaford is equable, but bracing for south coast health resort. Never very cold in winter, and summer heat always tempered by cool sea breeze, so that hottest days in summer are not relaxing. The climate is dry, rainfall being small and, owing to chalky sub-soil, quickly absorbed. There is a large amount of sunshine enjoyed, and nothing to intercept it. Golf, two clubs, each with gentlemen's links (18 holes) and ladies' course."

BOYS.

**NEWLANDS,
SEAFORD, SUSSEX.**

Mr. WILLIAM A. WHEELER, B.A.
(Keeble College, Oxford).

Mr. J. M. HAY GRANT, B.A.
(Emmanuel College, Cambridge).

Fees.—120 guineas per annum; 110 guineas for boys who enter under 10.

WESTON-SUPER-MARE.

The Medical Officer of Health writes:—"Lies on the shores of Weston Bay in the Bristol Channel, on the sea-ward of the Mendips, covering the southern slopes of Worlebury, and the alluvial and sandy plain at its foot. Well protected from the cold northerly winds by the Weston-Worle ridge, and open to pure invigorating breezes direct from the Atlantic Ocean, the town has an equability of climate through all the seasons of the year, difficult to find anywhere else in England. Its climate is equable and dry—bracing in summer, warm in winter, being sheltered against the east wind by the Mendip range. Favoured with a dry sub-soil, a high sunshine record, and remarkably free from infectious diseases, the town is admirably suited for invalids and delicate children, and is pre-eminently delightful as a holiday centre, with numerous beauty spots."

A spacious asphalted marine parade and carriage drive extends for over two miles; protected by a sea wall. The piers of Weston-super-Mare are amongst its chief attractions. Ample opportunities for marine excursions. On Knightstone are swimming baths, and a handsome pavilion, capable of seating 2,500 people, used principally for theatricals. Public Library and Museum. Electric trams.

PARKS.—Grove Park, at the base of Worlebury Woods, bandstand. Clarence Park, lawns and flower beds, and recreation ground. Prince Consort Gardens, situated on the slopes of Worlebury Hill; sea views.

WORLEBURY WOODS.—Nearly 300 acres, open to the public.

RECREATIONS.—Golf links (18 holes) on sea front. Cricket, tennis, bowls, archery. Rifle range (3 miles); miniature range in Town. River angling.

Sunshine (1916), 1,446 hours. Water supply, constant. Drainage, modern. Soil, sandy. Baths, sea water, swimming, Turkish, etc. Bathing, mixed.

BOYS.

(Founded 1877.)

ETONHURST

DEBENTURE STOCK - - - - - £331,130

Chairman: JOHN CROFT DEVERELL, Esq.

Deputy-Chairman: RICHARD STEPHENS TAYLOR, Esq.

PURCHASES.—The Society purchases Reversions and Remainders, whether absolute or contingent, Life Interests, whether in possession or deferred, and generally all Interests (in approved property) that depend upon the duration of human life.

LOANS.—The Society also grants Loans on the security of such Interests, either on Ordinary Mortgage or by way of Reversionary Charge. The latter mode meets the convenience of borrowers who do not wish to make any payment for either principal or interest until their Reversionary Property falls into possession. The amount to which the Society will then be entitled is fixed at the outset, and does not depend on the time elapsing between the grant of the Loan and its repayment.

Forms of Proposal and full information can be obtained at the Society's Offices.

Claims Paid,
Over £10,000,000

BY APPOINTMENT.

GENERAL

ACCIDENT FIRE AND LIFE

ASSURANCE CORPORATION, LIMITED.

Established 1885.

WAR ECONOMY.

In consequence of the War, the cost of building material and labour has increased fully 100 per cent. All owners of property should therefore increase their Fire Insurances; this they can do at little or no extra cost by taking a Fire Bonus Policy with this Corporation and thus effect a saving of 20 per cent. of each premium.

The Scheme has been in operation since 1908, and thousands of Policies have matured and have been renewed free.

ALL CLASSES OF INSURANCE BUSINESS TRANSACTED.

Chief Offices: { **GENERAL BUILDINGS, PERTH, SCOTLAND.**
 { **GENERAL BUILDINGS, ALDWYCH, LONDON.**

General Manager: F. NORIE-MILLER, J.P.

LAW FIRE INSURANCE SOCIETY

LIMITED,

114, CHANCERY LANE, LONDON, W.C. 2.

FIRE.

Personal Accident and Disease. Burglary. Fidelity Guarantee.
Workmen's Compensation, including Domestic Servants.
Property Owners' Indemnity. Third Party. Motor Car. Plate Glass.

BONDS.—The Directors desire to draw special attention to the fact that the Fidelity Guarantee Bonds of this Society are accepted by His Majesty's Government and in the High Court of Justice.

CHARLES PLUMPTRE JOHNSON, Esq., J.P., Chairman
(Formerly of Johnson, Raymond-Barker & Co., Lincoln's Inn).

ROMER WILLIAMS, Esq., D.L., J.P., Vice-Chairman
(Formerly of Williams & James), Norfolk House, Thames Embankment.

Secretary—H. T. OWEN LEGGATT. Assistant Secretaries—(GEORGE EVANS, ' W. R. LAWRENCE.

SECURITY UNSURPASSED.

Every facility is afforded for the transaction of Insurance business on the most favourable terms, and surveys, where necessary, are undertaken by the Society free of charge. Prospectuses and Proposal Forms and full information may be had at the Society's Office. The business of this Society is confined to the United Kingdom.

NORWICH UNION LIFE INSURANCE SOCIETY

GREAT in Age. It is a Centenarian in its own right, and, by its absorption of the Amicable Society, the **OLDEST LIFE OFFICE IN THE WORLD.**

GREAT in Volume of Business. Its Annual New Business for many years past has been in excess of that of any other British Life Office not transacting Industrial business.

GREAT in Profit-Earning Capacity. The Quinquennial Valuation as at 30th June, 1916, *on exactly the same strong 2½% Reserve basis as in 1911*, disclosed a surplus of £612,552, after the writing off of £806,032 as the full measure of war shrinkage of invested funds and excess war mortality. The surplus distributed for the previous quinquennium was £627,504.

GREAT in Reserve Strength. After two years of war strain, reserves were set aside on the basis of a strictly net premium valuation at an assumed net interest earning rate of only 2½%, in addition to which a further sum of £383,575 was reserved as a Floating War Contingency Fund.

GREATEST in the Fact that the Directors at this war juncture maintained reserves on an even more severe basis than the exceptionally strong standard of 1911.

Write for Prospectus and Valuation Report to Dept. 7,

NORWICH UNION LIFE OFFICE, NORWICH,

Will you share in our World-wide Work for Sailors?

The Sailors' Society works through the world for the spiritual and material welfare of all Sailors. By contributing to its Centenary Fund you can share in its noble work.

During the past year it has received and cared for more than 33,000 survivors from Mined or Torpedoed Ships; fed and clothed British Sailor Prisoners of War in Germany; helped the Widows, Orphans and aged Parents of the Fallen; maintained and extended the work of its Homes and Institutes throughout the World.

BRITISH & FOREIGN

CHURCH MISSIONARY SOCIETY

SALISBURY SQUARE, LONDON, E.C. 4.

Vice-Patron - - - THE ARCHBISHOP OF CANTERBURY.
President - - - COL. SIR ROBERT WILLIAMS, Bt., M.P.
Honorary Secretary - - THE REV. CYRIL C. B. BARDSLEY, M.A.

WORLD WORK. The Society's operations cover large areas in Africa, India, Ceylon, China, Japan, Palestine, Turkish Arabia, Persia, North-West Canada, and British Columbia. It holds many important strategic positions in nearly every mission field, in some of which no other Society is at work. The Society has upon its staff 1,329 European Missionaries, and 11,383 native Christian workers.

EMPIRE BUILDING. During the past year there were 39,666 baptisms (21,377 being adults); 271,760 scholars attended 4,133 schools and colleges; and the mission hospitals received 41,006 in-patients and 1,166,571 visits from out-patients. In many lands the Society is doing all in its power to develop the Native Churches in the direction of self-government, self-extension, and self-support. There are large Mass Movements towards Christianity in India and Africa—movements which bring in their train an overwhelming demand for Christian teachers, native and European.

MUNITIONS OF WAR. An increase of income is essential if we are to touch even the fringe of ever-increasing opportunities in every part of the mission field. About £400,000 per annum is needed to carry on existing work. Contributions may be sent to the local secretaries or to the Lay Secretary, H. Lankester, Esq., M.D., at the above address.

Further information can be obtained on application to the Secretaries, Church Missionary House, Salisbury Square, London, E.C. 4.

CHURCH PASTORAL-AID SOCIETY.

"Our country for Christ."

Patron: HIS MAJESTY THE KING.

Nearly Six Millions of our population live in parishes helped through the Society's Grants. The 1090 Clergy, Lay Agents and Women Workers supported by these Grants strive to help and to win for Christ the poor and all who dwell in the purlieus of our large cities and towns.

FUNDS ARE URGENTLY NEEDED NOW.

President: J. F. W. DEACON, Esq., J.P., D.L.

Secretaries: Rev. T. C. CHAPMAN, M.A., and A. THOMAS, Esq.

Offices: FALCON COURT, 32, FLEET STREET, LONDON, E.C. 4. [142]

Colonial and Continental Church Society.

Patron—HIS MAJESTY THE KING.

Vice-Patrons—THE ARCHBISHOPS OF CANTERBURY, YORK, ARMAGH, DUBLIN, &c.

Chairman of Committee—S. H. GLADSTONE, Esq.

Secretary—The Rev. J. D. MULLINS, M.A., D.D.

This Society exists for the purpose of supplying the means of grace to our fellow-countrymen abroad, especially in those parts of the Empire where they are in danger of drifting into irreligion for lack of the Gospel.

Forty-five Colonial Dioceses receive aid from the Society, including those in Canada, Australasia, South Africa, East Africa, the West Indies, and India. Many Colonial Bishops are applying for far more aid than the Society's funds can meet.

Owing to the enormous influx of settlers to the Colonies, the Society started in 1906 a SPECIAL N.-W. CANADA FUND, and in 1912 an AUSTRALIAN FUND.

249 Clergy and Lay Evangelists have been sent out, 120 Prairie Churches built, and more than £165,000 has been expended in the West. £12,000 per annum is required to maintain the agents in Canada.

Assistance is also given to ministrations among British Artizans, Sailors and others in Continental cities; and Services (self-supporting) are organized for visitors at health resorts.

During the War the Society's Chaplains have rendered devoted service to thousands of British residents, refugees, and sick and wounded soldiers. Three of them, in BRUSSELS, LILLE, and CROIX, remained at their posts, behind the German lines.

CITY OF LONDON TRUSS SOCIETY

For the Relief of the RUPTURED POOR throughout the Kingdom.

Instituted 1807.

35, FINSBURY SQUARE, LONDON, E.C. 2.

Patron—HIS MAJESTY THE KING.

The average number of poor persons suffering from the dangerous and distressing malady of Hernia or Rupture annually relieved by this charity during the past twenty-five years has been over 8,000. The Patients are of both sexes and from all parts of the Kingdom. The youngest patient relieved was an infant of seven days old; the oldest, a woman of 107 years. Every patient attending at the Institution is treated by the Surgeons of the Society by whom the Truss is applied.

ADDITIONAL FUNDS ARE URGENTLY NEEDED to enable the Committee to carry on the beneficent work of the Charity, which necessitates an expenditure far in excess of its income. Annual subscribers of one guinea or more are entitled to recommend four patients within the year for every guinea so subscribed.

ONE LETTER OF RECOMMENDATION ONLY is required, however expensive the necessary instrument may be.

W. K. TAUNTON, Secretary.

Treasurer—GERALD D. SMITH, Esq.
Secretary—H. C. STANILAND SMITH.

[145]

GENERAL LYING-IN HOSPITAL,

York Road, Lambeth, S.E. ESTABLISHED 1765.

Patrons—H.M. The Queen and H.M. Queen Alexandra.

This Hospital is situated in one of the poorest parts of London, in the district South of the Thames, with a population of nearly two millions.

Married women in indigent circumstances, especially the wives of Soldiers and Sailors, and certain single women (with their first child, after investigation by the Committee), are admitted to the Hospital from all parts of the kingdom, but mainly from the immediate neighbourhood, from which, owing to its poverty, little pecuniary help is obtainable.

Subscriptions and Donations thankfully received by the Treasurer, or Miss ROSE E. WHYTE, the Secretary, at the Hospital. [146]

THE GIRLS' FRIENDLY SOCIETY.

Patrons—HER MAJESTY THE QUEEN; HER MAJESTY QUEEN ALEXANDRA.

The G.F.S. is an Imperial Society, which links together over 300,000 girls and women of all ages and of all ranks of society in all parts of the world for mutual help. Its object is

"To unite for the Glory of GOD in one Fellowship of Prayer and Service, the Girls and Women of the Empire, to uphold Purity in Thought, Word, and Deed."

"The Society offers friendly comradeship and opportunities of service for others through introductions from Branch to Branch, and from one country to another. It also encourages loyalty and faithfulness in work and home life, and self-control in all things."

The various departments of G.F.S. work include help for Sick Members and an Invalids' Work Depot, After-Care of Girls from Poor Law Institutions, Protection in Migration and in Travelling, the provision of Huts, Clubs, Hostels and Homes of Rest, Industrial Training, War Savings, and Employment and Registry Work. The Society works in connection with the Ministry of Labour and Women's War Services.

All information can be obtained from—

Telegrams: "AUGUST, VIC., LONDON."

Telephone: 2521 VICTORIA.

THE GORDON BOYS' HOME

(THE NATIONAL MEMORIAL TO GENERAL GORDON).

Patron—THE KING.

Vice-Patrons—H.M. THE QUEEN and H.M. QUEEN ALEXANDRA.

THE HOME IS SITUATED AT WEST END, WOKING, NEAR BROOKWOOD.

OFFICES—5, YORK STREET, ST. JAMES'S, S.W.

The Home is constructed to accommodate 250 Boys, chosen from the homeless and destitute, between the ages of 13½ and 15½, and give them a training, up to the age of 17 or thereabouts, which will fit them alike for civil life in this country or its Colonies, and for service in the Army, Navy or Mercantile Marine.

CONDITIONS OF ADMISSION.—1. The age for admission is from about 13½ to 15½ years. 2. A boy must, in the opinion of the Committee, be really necessitous. 3. He must be free from such physical or mental infirmity as would disqualify him for service in the Army or Navy, or for civil employment in the Colonies or elsewhere, which would require active bodily exertion. 4. Boys of known bad character are ineligible.

Free admission is given to such number of boys as above as can be provided for out of the general income of the Home. A guaranteed payment of £22 annually during his stay at the Home will give a right of nomination for a lad fulfilling the conditions of admission. Subscriptions and Donations are urgently needed in order that the above number of boys may be maintained.

Subscriptions are received by THE LONDON COUNTY AND WESTMINSTER BANK, 1, St. James's Square, S.W.; by the Treasurer, General the Right Hon. Sir DIGHTON PROBYN, V.C., G.C.B., Marlborough House, S.W.; and by the Secretary, at the Office, 5, York Street, St. James's, S.W., from whom any further information can be obtained.

E. G. MARKHAM, Esq., Secretary.

GUY'S HOSPITAL

LONDON BRIDGE, S.E. 1.

BEDS, 643. IN-PATIENTS (1917), 8,892. OUT-PATIENTS, 97,267.

The Governors Earnestly Appeal for:—

NEW SUBSCRIPTIONS, DONATIONS, and TESTAMENTARY GIFTS to meet the large difference of over £50,000 per annum between assured Income and total Expenditure.

A Legacy or Donation of £1,000 names or endows a Bed in perpetuity.

A Legacy or Donation of £500 names or endows a Cot in perpetuity.

A Yearly Subscription of £50 or £25 supports a Bed or a Cot respectively.

A copy of the last published Annual Report of the Hospital will be forwarded on application to The Clerk, Counting House, Guy's Hospital, S.E. 1.

THE HOSPITAL FOR DISEASES OF THE SKIN,

Telephone: Hop 1021.

70-71, BLACKFRIARS ROAD, S.E.

ESTABLISHED 1841.

Patroness—HER MOST GRACIOUS MAJESTY QUEEN ALEXANDRA.
Vice-Patron—THE RIGHT HON. LORD HAVERSHAM. *Treasurer*—ROBERT BARCLAY, Esq.
President—THE RIGHT HON. THE EARL OF KINNOULL.

This Hospital, which was the first and for many years the only Institution in the United Kingdom for the special treatment of Cutaneous Diseases, was rebuilt in 1915, and it is fully equipped with the most modern appliances for the treatment of Diseases of the Skin. The expense of re-building has greatly depleted the reserves of the Hospital, and further subscriptions and donations are earnestly desired for the purpose of replacing this loss. The practice of the Hospital is open to all qualified medical practitioners and senior students.

Over 510,000 patients have been treated at this Hospital since its foundation.

Patients are required to contribute towards the funds of the Hospital according to their means, and should attend daily at 1.30 p.m., or on Fridays at 6 p.m.

This Hospital is a centre for the treatment of Venereal Diseases under the London County Council scheme.

FREDERICK HAYTER, *Secretary*. [152]

LONDON CITY MISSION

Instituted 1835.

312 Agents Employed.

The Society exists for the social and spiritual uplift of the millions of London, chiefly the poor and the artisan classes. Besides preaching the Gospel from house to house, and in Hospitals and Poor Law Institutions, the Missionaries visit the great centres of industry—Government works, docks and wharves, rail and goods yards, public offices, and wherever the masses foregather, either for business or pleasure—teaching the principles of righteousness and truth, and urging their application to daily life and conduct.

£1,000 weekly is required for the maintenance of the Society's daily operations among the poor and working classes of the Capital.

Chairman and Treasurer: F. A. BEVAN, Esq., D.L., J.P.

Secretary: THE REV. W. P. CARTWRIGHT, M.A.

Bankers: BARCLAYS BANK, LTD.

Headquarters: MISSION HOUSE, 3, BRIDWELL PLACE, LONDON, E.C. 4.

LONDON LOCK HOSPITAL AND RESCUE HOME

Patron - - - H.M. THE KING.

UNENDOWED AND IN GREAT NEED.

Treasurers:—LORD KINNAIRD, K.T., and J. F. W. DEACON, Esq., M.A., D.L., J.P.

Founded in 1746, this Special Hospital has for 173 years devoted all its energies to the treatment of venereal diseases. Thousands of young women and girls from all parts of the kingdom have been relieved of their bodily suffering and helped to regain their self-respect, and thereby enabled to make a fresh start in life. **ANNUAL SUBSCRIPTIONS AND DONATIONS ARE EARNESTLY PLEADED FOR**, and will be gratefully received by the Secretary.

Offices: 283, HARROW ROAD, LONDON, W. 9.

FORM OF BEQUEST.—I bequeath to the Treasurers for the time being of the London Lock Hospital and Rescue Home, Harrow Road, Paddington, W., and Dean Street, Soho, both in the County of Middlesex, the sum of £ to be applied for the purposes of the Female Hospital, Rescue Home (or Male Hospital and Out-patients' Department, as may be desired) and I direct the said Legacy to be paid free of death duty, and as soon as conveniently may be after my death.

Under the Patronage of HIS MAJESTY KING GEORGE V. HER MAJESTY QUEEN MARY,
 HER MAJESTY QUEEN ALEXANDRA.

LONDON ORPHAN SCHOOL

WATFORD

(Incorporated as the London Orphan Asylum).

The Managers very earnestly appeal for help towards the maintenance of the 450 Fatherless boys and girls now in the School from all parts of the **BRITISH EMPIRE**, representing all professions and callings. 7,600 such children have been maintained and educated, the majority having been provided with situations.

The School, which has been in existence for over a century, now needs **£20,000** in addition to assured income owing to the large increase in the cost of all necessities.

Children of Officers and Warrant Officers killed in the War have been admitted and are still being received without election.

Annual Subscriptions from 10s. 6d., Life Subscriptions from £5 5s. **DONATIONS will be gladly received.**

ROYAL BLIND PENSION SOCIETY

Patron—HIS MAJESTY THE KING.*Honorary Secretaries* MESSRS. GEORGE POCOCK AND PERCY R. POCOCK.

This Society grants Pensions to the Blind Poor at their own homes in sums ranging from **10s. to 25s.** per month. There are upwards of **1,200** pensioners, residing in various parts of the Kingdom, among whom nearly **£10,000** is annually distributed.

To be eligible, applicants must be totally blind, above 21 years of age, of good moral character, and in receipt of an income not exceeding **£50**, if single, and **£30** if married. No distinction is made in regard to sex or creed; not is the receipt of parish relief a disqualification.

Application must be made on the printed forms provided by the Society.
 Subscribers of **10s. 6d.** annually, or Donors of Five Guineas, are entitled to One Vote at every election, and multiples thereof in proportion.

Contributions will be gratefully received by the Treasurer, or by the BANK OF ENGLAND, or Messrs Barclay and Co.

237, SOUTHWARK BRIDGE ROAD, LONDON.

W. ELLIOTT TERRY, Secretary.

THE ROYAL HOSPITAL AND HOME FOR INCURABLES PUTNEY HEATH.

*Instituted 1854.**Patrons*—

HIS MAJESTY KING GEORGE V.

HER MAJESTY THE QUEEN.

HER ROYAL HIGHNESS PRINCESS CHRISTIAN.

President—THE RT. HON. LORD WOLVERTON.*Treasurer*—SIR HENRY LOPES, BART.

"The tragedy of writing a good letter is that one cannot be there when it is opened." The Board of the ROYAL HOSPITAL AND HOME FOR INCURABLES, PUTNEY HEATH, make many urgent appeals, but they are "not there" when the appeals are read. Perhaps if friends could hear *all* the reasons the Board have for making the appeals the response would be more satisfactory. **Funds Urgently Needed.**

Secretary : P. J. MICHELLI, C.M.G., Seamen's Hospital, Greenwich. [184]

Society for the Abolition of Vivisection

22, NORTHUMBERLAND AVENUE, LONDON.

According to the latest Parliamentary Return, the number of experiments made in 1917 was 55,542. A large number of these were inoculation experiments, and, as the report says, "are attended by no considerable, if appreciable, pain."

The pain does not lie in the operation itself, but in the after effects.

The animal so innocently operated on may have to live days, weeks or months with no anaesthetics to assuage its sufferings, and nothing but death to relieve.

The following is an example of what may ensue in the dog after the "little needle prick" :—

"A dog was inoculated on January 23rd. In a few days it began to show signs of wasting, then the head became swelled and dropsical, and also the fore-legs and paws; later on this swelling disappeared, but the dog seemed very ill and weak, and there was a thickening of the membrane of both eyes. Two days before its death it refused food and seemed very thirsty. On February 20th it died."—Abridged from the *Journal of Pathology and Bacteriology*, March, 1906.

The Society offers to send a Lecturer, free of charge, to Literary Societies, League Meetings, &c. [193]

CONTRIBUTIONS TO THE SOCIETY GRATEFULLY ACKNOWLEDGED

SONS OF THE CLERGY CORPORATION

 Cheques, etc., crossed and payable "Waifs and Strays."

[140]

WEST LONDON HOSPITAL, HAMMERSMITH ROAD, W. 6.

(Incorporated by Royal Charter, Nov. 1st, 1894.) Supported by Voluntary Contributions.

Patron—HIS MAJESTY THE KING.

President—His Royal Highness PRINCE ARTHUR OF CONNAUGHT, K.G., K.T., G.C.V.O., P.C.

Treasurer—Major LIONEL DE ROTHSCHILD, M.P., O.B.E.

Chairman of Finance Committee—The Right Hon. LORD ARTHUR HILL, P.C. Chairman—GEORGE F. MARSHALL, Esq.

IT needs:—£63,000 to carry out the scheme of extension by which provision is made for about 250 beds; and £26,000 annually to maintain the present work of relieving about 2,300 In-Patients and 31,000 Out-Patients. Its endowments yield an annual income of only £1,400. Wherefore it relies upon voluntary contributions for £24,600 wherewith to meet its annual expenditure of £26,000. For many years past the debt has averaged £10,000.

It is the nearest General Hospital for Hammersmith, Fulham, Acton, Chiswick, Brentford, and for large portions of Kensington and Barnes. The population it serves numbers more than 500,000 persons. It is entitled to receive and hold devises of freehold land or any other property.

A. BETTERIDGE, Secretary.
